Theatre and Office Building, East side Hanover street, between North Warren and Chancery lane, Trenton, N. J. Architects, Eugene De Rosa, Inc., 16 West Forty-fourth street, New York. Owners, Hirschfeld & Hildinger, care of architects. Architects taking bids due May 19th.

Store and Apartment, 1428 Atlantic avenue, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic Delicatessen Co., 1328 Atlantic avenue, Atlantic City, N. J. Fireproof, 2 stories and basement, slag roof, concrete floors. Architect taking bids.

Parochial School, Pleasantville, N. J. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, St. Peters Roman Catholic Church, Dr. F. J. McCallion, Pleasantville, N. J. Brick, steel, 3 stories, 127x80 feet, slag

roof, maple and pine and cement floors, steam heat, electric light, metal lath, bond, ornamental iron work. Architect taking bids due May 13th at noon.

Street Paving, Camden, N. J. Engineers, Remington & Vosbury, 509 Cooper street, Camden, N. J. Owners, Delaware Township Commissioners, M. Wermuth, Ellensburg, Pa. Bond, 100 per cent. Certified check, 10 per cent. Deposit, \$10, refund \$5. Owners taking bids due May 9th, 8 P. M. (Daylight Saving Time). Approximately 4,530 square yards concrete paving, 970 square yards concrete paving, 100 lineal feet concrete curbs, 112 lineal feet radius curbs, 2,290 cubic yards excavation, 480 square feet concrete sidewalks.

Pennsylvania Railroad, C. E. Walsh, purchasing agent, 15 North Thirty-second street, Philadelphia. Contract No. 51, rubber insulated wire and cable and H. D. copper wire. Owners taking bids due May 19th at noon (Standard Time).

Paving, Barrington, N. J. Engineer, J. J. Albertson, Camden, N. J. Owners, Borough of Barrington, H. J. Stove, Barrington, N. J. Certified check, \$250. Owners taking bids due May 12th, 8 P. M. (Daylight Saving Time). 5000 lineal feet curb and gutter combined, 2,440 square feet sidewalks, 450 cubic yards excavation, 20 trees to be removed.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Owners taking bids due May 16th, at 11 A. M. (Eastern Standard Time). Certified check, 10 per cent. Deposit, \$10.

Pennington-Woodville road, State Highway Route 30, Revision of 1927, Mercer County. Earth excavation, rock excavation, 8-inch double line reinforced concrete pavement, (4) small span bridges.

Woodville-Ringoes road (State Highway Route 30, Revision of 1927), Hunterdon County. Earth excavation, rock excavation, borrow, 8-inch double line reinforced concrete pavement, (5) small span bridges.

Embankment and Abutment, Section No. 14-B, Route 1 Extension, Contract No. 6, Newark, N. J. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Fill for embankment, concrete. Deposit, \$50. Certified check, \$25,000. Owners taking bids due May 23rd at 11 A. M. (Eastern Standard Time).

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Route 7, Section 8, Lakewood to Aldrich road, Monmouth and Ocean Counties. Excavation, double line reinforced concrete pavement, gravel surface, (1) 45-foot span bridge. Certified check, 10 per cent. Deposit, \$10. Owners taking bids due May 23rd, at 11 A. M. (Eastern Standard Time).

Miscellaneous Work, various schools, Camden, N. J. Owners, Board of Education, M. Wessel, Camden, N. J. Owners taking bids due May 24th, 2 P. M. (Daylight Saving Time). Cement sidewalks, curbing, school yard, cellar floors. Certified check, \$25.

New Jersey Contracts Awarded

Pavilion and Comfort Station, Beach Haven, N. J. Architect, private plans. Owner, Borough Council, Beach Haven, N. J. Reinforced concrete and cement work, electric light and plumbing. Contract awarded Floyd Cramer, Beach Haven, N. J.

Auto Supply Station, Twenty-first and Federal streets, Marlton Pike, Camden, N. J. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owner, W. A.

Jarden, Fifty-fifth and Lancaster avenue, Philadelphia. Brick, cut stone, granite, reinforced concrete, steel, 1 story and basement, 38x50 feet, slag roof, composition, cement and pine floors, metal windows and grills, metal ceilings, dampproofing, ornamental terra cotta, ornamental iron work, metal bulks, bond, tin-clad doors, metal lath, steam heat, electric, concrete footings, bluestone, wrought iron pipe. Contract awarded D. Lutz & Co., Twenty-third and Chestnut streets, Philadelphia.

Warehouse and Garage, New White Horse Pike, North of Colt avenue, Camden. Architect, LeRoy B. Rothschild, 215 South Broad street, Philadelphia. Owners, Security Warehouse Co., Broadway and Cooper streets, Camden, N. J. Brick, reinforced concrete, steel, granite, 8 stories and basement, 60x130 feet, slag roof, cement floors, elevator, painting, glazing, architectural terra cotta, ornamental iron work, floor hardener, bond, fire, kalamein and hollow metal doors, rolled steel sash, marble and terrazzo work, steam heat, rolled steel shutters, incinerator, plumbing, metal lath, electric light, metal toilet partitions. Contract awarded Karno Smith Co., Trenton, N. J.

Residence, Overbrook and Edgewood avenues, Trenton, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, J. Papier, 752 Edgewood avenue, Trenton, N. J. Cinder block, stucco, 1½ stories, 50x56 feet, Spanish tile roof, hardwood floors, electric light, tile work. Contract awarded to Grover Sessler, 18 South La Salle street, Trenton, N. J.

Store and Apartment (add. and alts.), 105 West State street, Trenton, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, Dr. J. S. Miller, Broad and State streets, Trenton, N. J. Brick, limestone, 3 stories, 25x100 feet, slag roof, hardwood floors, metal ceilings, vapor heat, electric light, tile work. Contract awarded to W. C. Ehret, Trenton Trust Building, Trenton, N. J.

Church and Sunday School (alts. and add.), Pennington, N. J. Architect, G. E. Savage, Witherspoon Building, Philadelphia. Owners, First Presbyterian Church, C. M. Titus, Pennington, N. J. Brick, 2 stories, electric light. Contract awarded J. Ross & Son, Wilkinson Building, Trenton, N. J.

Store and Residence, 1218 Kaighn avenue, Camden, N. J., \$15,500. Architect, Howard E. Hall, 218 Weikel avenue, Merchantville, N. J. Owner, Abe Rosenkrantz, 1220 Kaighn avenue, Camden, N. J. Brick and block, 2 stories, 20x76 feet, slag roof, hot water heat, electric light. Contract awarded to James D. Hill, 122 Woodlawn avenue, Collingswood, N. J.

Building (add.), 245 Spruce street, Camden, N. J., \$3,000. Architect, private plans. Owner, Annantonia Garausa, on premises. Brick, 2 stories, 17x36 feet, slag roof. Contract awarded to Joseph Di Medio, 1105 South Fourth street, Camden, N. J.

Miscellaneous Construction News

Residence and Garage, Winston-Salem, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, George W. Coan, Jr., care of architect. Hollow tile, stucco, 2½ stories, vapor heat, electric light, tile roof, hardwood floors, tile work. Plans in progress. Will be ready for bids in two weeks.

Armory, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owners, State Armory Commission, W. E. Hoopes, secretary, DuPont Building, Wilmington, Del.

Brick, stone, steel, 1 story, 180x150 feet, composition roof, dumb waiters, cut stone, cast stone, ornamental iron, iron stairs, hollow metal doors, steel sash, tile work (heating, plumbing, electric separate). Owners taking bids due May 18th.

Church, Granogue, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owners, Talley Mission Chapel, Elwood Evans, Concord pike, Wilmington, Del. Brick, frame, 1 story, shingle roof, pine floors, electric light. Owners ready for bids.

Residence, Westover Hills, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owner, J. H. Hudson, 1513 Delaware avenue, Wilmington, Del. Brick, hollow tile, 3 stories, 30x100 feet, slate roof, hardwood floors, vapor heat, electric light, tile and marble, metal casements, flagstone. Architects taking bids.

Store (alts. and add.), 610-12 Market street, Wilmington, Del., \$15,000. Architect, private plans. Owners, Isaac Silver & Brother, 130 Fifth avenue, Wilmington, Del. Brick, 2 stories, slag roof, general alterations. Owners will build.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Owners taking bids due June 1st at 2 P. M. Deposit, \$2.00. Certified check, 10 per cent.

Contract No. 82, State Road-Wilmington Causeway (widening), 5.245 miles. Excavation, borrow, broken stone base course, cement concrete pavement, premoulded transverse expansion joint, concrete reinforcement, corrugated metal pipe, R. C. pipe, underdrain, concrete gutter, concrete curb, guard rail, shoulder curb, sheet piling.

Contract CS57, Midway-Angola, 6.3 miles. Clearing, grubbing, borrow, excavation, cement concrete pavement, concrete reinforcement, metal pipe, R. C. pipe, wood shoulder curb, timber piling, sheet piling.

Miscellaneous Contracts Awarded

Church, Baltimore, Md. Architect, C. J. Lappley, Harrisburg, Pa. Owners, Walbrook Evangelical Church, Rev. Thompson, Baltimore, Md. Stone, brick, 1 and 2 stories, slag roof, hardwood floors, electric light, tile work, cast stone, casement windows. Contract awarded J. S. Foose, Harrisburg, Pa.

PROGRESS OF BUILDING INDUSTRY DEMANDS ELIMINATION OF WASTE

An Address by CHARLES F. ABBOTT, Executive Director, American Institute of Steel Construction, Inc., 225 Madison Ave., New York City

(Continued from last week)

An ill-advised selection will, however, inevitably result in a waste of the taxpayer's money. The Institute's recently organized staff of Field Engineers has as one of its principal objectives contacts which will enable it to afford expert and disinterested advice concerning the selection and use of materials. Steel will be recommended only when it can properly fulfill the demands which will be made upon it.

The Field Engineers, and the Institute's Department of Architectural Rela-

tions, will also seek to be of service to owners, contractors, engineers, architects, and the students and faculties of the technical schools. The Institute's technical staff will in no sense usurp the functions of the architect and engineer. It will make available the latest data regarding the design and erection of steel, and will leave the execution of the work to those best fitted to perform it.

The structural steel industry is the industry that has made possible the towering steel-frame skyscrapers and the great steel bridges of the present day. It is the industry that will make possible the construction of the 85-story Book Tower in Detroit, the 110-story Larkin Tower in New York, and the 3500-foot steel span over the Hudson River at Fort Lee.

Buildings large enough to shelter the inhabitants of a fair-sized city, and bridges spanning the broadest rivers in the land, have contributed much to the advance of civilization during the thirty-five years that have passed since steel was first used as a building material. The move of the industry towards the elimination of waste is another step towards the advance of civilization and the welfare of the general public.

Waste of any kind is a menace to the public welfare. It is a menace to the industry that permits it, and to all allied with the industry or dependent upon it. In the end the public pays the bills. That part of the payment which represents waste is deducted from the total amount the nation can spend for constructive activities. In the case of the building industry, it is deducted from the amount the nation can spend for new buildings, new bridges, and other structures.

It is estimated that the building program for 1927 will entail an expenditure of \$6,000,000,000. No one can say how much of this will go for waste. It will be a considerable proportion and it will benefit no one. If that proportion, instead of being squandered, could be applied to additional construction, it would benefit us all.

Co-operation between all the elements of the building industry will alone make such an application possible. Co-operation, resulting in a reduction in costs and the promotion of the most effective use of materials, will assure a continuation of that activity in construction upon which the bread and butter of each one of us depends.

Instead of reaching a saturation point we will see greater buildings and bridges than the imagination of our architects and engineers has yet conceived. We will enter upon a Golden Age of buildings the like of which the world has never seen. Our structures will stand as monuments of a civilization that was able to combine sound economic practices with technical skill.

THE COUNTRY HOME

The Influence of the Landscape

BY RAYMOND BROOKS

*Ah yet, ere I descend into the grave,
May I a small house and large garden
have.* —Cowley.

There are, generally speaking, just four kinds of house sites namely, the open country or farm site, the sea shore, the stony country, and the woodland. Usually a plot of country ground, no matter how small, falls into one or another of these four classes. The characteristics of each type have a certain subtle influence over the dweller thereon. Man speaks of the spirit of the woods or the spirit of the hills, meaning the full power of their beauty over himself, and when he goes to dwell among them his dwelling must be worthy of his surroundings and suitable to his needs. A house at best is an unnatural thing set down among fields and trees, and the problem is to make it look at home there. So many houses are built with no relation whatsoever to their location. Not far from where we live there is a miniature castle with battlemented turrets, and all the signs of an expected siege. It is surrounded by corn fields and farm houses, a strange location considering the quarrelsome nature of its architecture. A high house designed for the restricted space of a city lot looks odd set down in the midst of open country. These are perfectly obvious examples, but there are many other cases where the mistake is not so clear. The house may be beautiful in itself, and the surroundings beautiful, but if they do not have something in common, something to make the house and land one, the whole will lack the strength of unity, and the convincingness of suitability.

Level fields of farm hold volumes of interest, though as house sites they have their drawbacks. A friend of ours, owner of a house so situated, has his meals quite ruined for him because his dining room window happens to look over the plowed land of his farm. His eye roves over his fields while his morning peaches and cream go down his throat, their lusciousness unnoticed. Presently he spies something amiss in the orchard, and his coffee, that solemn ritual of the morning, is finished in a few gulps, and he is gone to remedy matters.

But the proximity of the farm makes certain demand on architecture. If the land is level and there are a few trees a house at once becomes a conspicuous object, and its style of architecture, its color, and the lack of judicious planting may all contribute towards divorcing house and landscape.

With the simple life at your door, your house must be simple, too. A low spreading wooden structure painted white or light gray, and following pretty closely

the lines of a New England farm house would have the charm of tradition, especially if there were some venerable apple trees to lend the countenance of age. Certain brick houses, notably the English cottage type are good in the open country though it is to be remembered that because of the color brick needs more of a garden before it appears to be at one with the ground it is built on.

A new house is raw to look at and years pass before the scars of building are finally effaced, but the landscape assimilates an old house, as it were, the hills and fields accept it, vines cling to it, the weather mellows its color to something rich and natural. Nothing but age can give this ripeness and maturity of beauty but much can be gained by skillful planting.

A garden forms an easy transition between the precise lines of a house and the open country. It is a go-between and a mediator and is at its best when it takes on a little of the character of both. A prim box tree or two near the house, and on the outskirts more irregularity and freedom. Certain gardens welcome you, gay and rambling gardens full of unexpected delights, others in their austere formality give an impression of positive gloom. If the character of the house is decided by the landscape, then should the garden take its cue from the house, and each will prove the other's good excuse for being. The simple house will have its simple garden, and the English house its clipped hedges and wall flowers.

When a house is adequate in every detail with nothing false or hypocritical in its structure, the result is usually good. Windows should be built for light and air, and chimneys to draw and whatever ornament either receives should acknowledge the true purpose of windows and chimneys and not interfere with their functioning. This applies to all the other purpose-filling features of a house as well and there is no reason why practical things should not also be beautiful.

With a house, as with the details of its architecture, the purpose to be filled should be the first thought. The land owner on the ocean shore has to meet other requirements on his house than does the farmer among his fields. If he builds high enough to view the sea he will be exposed to the tearing winds that come in salt laden, over the waves. There will be nights even in midsummer when he will draw close to the fire for warmth, while the wind pulls at doors and questions windows. Through the gales he will hear the deep-voiced booming of the waves, and if he puts his hand on the bare ground he will feel the tangible shock and recoil as the earth withstands the full strength of the waves in fury. Woe to the fragile house where windows rattle through sleepless nights.

Then if your dweller by the sea is wise he will remember the colors of the landscape around him. On the sea shore nature dips her brushes in clear pigments, and lays on her color in masses, lavishly. The white sands, the pure green of the coarse grass, and the deep blue of the sea and sky, these will be the setting. It is hard to imagine a better type of house for such a location than the Spanish missions. Their red tiled roofs are in perfect relation to the prevailing colors and the soft gray-white of the stucco walls have something in common with the sands. They could be easily modified according to the climate, more open in the south, less so in the north.

In climates where fertile gardens are difficult near the sea an inclosed court could be very felicitously used for this purpose. Rich soil could be kept there free from sand, and flowers could be grown there too delicate to stand the wind outside. The possibilities are endless—a fresh water pool, a bit of old marble and your court would be a spot different by leagues and centuries from the outside world. Stucco and red tile would not be so suitable on a stern and rock bound coast. Stone is not a logical material to build with, if there is no stone in the immediate neighborhood, but if there is an abundant supply it is not only the most logical, but the most practical as well.

With the house in the woodland the builder can have greater freedom and still hold to the admirable principle of harmony with the surroundings. He is less limited by nature. There are no strongly dominant colors as by the sea, and the architectural defects are not so evident as on an exposed piece of open ground. The natural material, of course, is wood, though stone and plaster are often as good, and the color could be almost anything but white. In the half twilight of the woods white is too ghostly.

The outstanding feature of the woods is psychological rather than physical. It is the effect the forests' ghostly solitudes have always had on the imagination of man. A large forest is not essential. It is sufficient if the wood is deep enough to produce the illusion of vastness and so thick that the sky appears only in blue patches through the leaves, and the light below is always a green twilight. The bark of a distant dog, and voices from the highway increase the sense of detachment rather than lessen it.

All this may seem rather intangible and abstract to have any effect on the very concrete fact of a house, but this wizard spirit of the woods has produced the greater part of folk lore and fairy tale. Why should it not set its mark on architecture as well? No house need be commonplace, but the house in the woods least of all. Let it be a well timbered house of some old English design, but for the de-

tails give free reign to the imagination, since the details will count. Build such a lattice window as Rapunzel used, when she let down her hair for the prince to climb. Let the beam ends appear through the walls, and carve each one into a face. The main supports of the house can be roughed to reproduce the old ax-hewn oaken beams of England. A wooden panel over the door can hold a whole pageant of quaint figures carved in low relief. The door knocker, the handle of the door—nothing is too small to receive its share of attention. Even the smallest cottage can present a wrought-iron lantern beside the door, and a roof suggestive of thatch.

The fourth house site, the rocky country, is one of the most interesting to the builder, whether it is the stony slopes of New England or the more imposing cliffs of the western mountains. There is a tradition about houses in New England and everyone is familiar with the type. They have had their share in New England's fame, these dignified little homes that sheltered the greatest men in the days when our country struggled for freedom. These houses were of wood, and so beautiful that they still are the best America has made. One might ask—"Why build a New England house of stone at all?" However, these old houses were located in towns and in the most fertile valleys where agriculture was easiest. Our ancestors were practical people—they could not afford to be anything else—and they tilled the soil they lived on. The stony and inaccessible places they left alone, or used for pasture. We, who choose a site for the sake of its view or its seclusion, are not at all in the same position. A white house with the beautiful fan windows of old times is ideal under the elm trees of a quiet village street, but altogether out of place half-way up the steep slopes of a mountain. In pioneer days the dwellers in these places used log cabins, which were all very well for the primitive life but hardly adapted to a house of more than three or four rooms.

Stones grow in New England; the farmers make fences of them; they are ready to the hand of the builder. The stone walls can be rounded like cobbles or cut flat; the door and window frames can be of trimmed stone or wood; the windows leaded. The house should be so placed that the most used rooms receive the greatest advantage of view, and the location studied carefully. The relation of the house to the landscape is just as important in stony country as elsewhere. Fences of stone and terraces walled up with stone relate the grounds and the house. Oftentimes houses are built on the very edge of cliffs and of the same kind of stone. The cliff face is continued on up to form the house wall so that the two merge gradually. The original ground line

can often be kept without grading and the foundation of the house built irregularly to correspond so that the house appears to be one with the original rock.

Thus far we have been able to give only in the most hasty and incomplete way some of the general principles for relating the house to the landscape. It is a subject no less interesting to work out than it is important to the ultimate success of a house. There now remains one type of home to be touched on very briefly, namely, the cottage.

In the mind of America a cottage is a compromise. It is a grade lower than a bungalow, and has some of the elements of camping out; it usually has an oil stove that smokes. But in spite of the inconveniences, the drafts and the spiders, it has a very important place in American life. In a cottage keeping up appearances is no longer a necessity, and the spirit of vacation reigns as long as the season lasts. The very name "cottage" is a proclamation of informality, and a license to build as simply as you like.

The beauty of a small building depends largely on its line of construction, that is today, the slant of the roof, the height of the walls, and the placing of doors and windows in good proportion and relation. There can be no specific rules about these things because they vary with each house, and all that can be done here is to point out where care should be taken. Small houses have an unfortunate habit of resembling faces. Eyes look at you in the upstairs windows and the door is a long and solemn mouth. This is caused by the absolute symmetry of arrangement, and can easily be avoided. Porches that shelter from the sun and include, if possible, a good view are quite as important to the summer cottage as a dining room, and should be given careful thought in relation to weather exposure and the avoidance of excessive sunlight, prevailing winds and rain.

Last of all, let me voice a plea for architects, those genial wizards of the drawing board possessing as a class a fine sense of the dignity and significance of their work, and as individuals a ready knowledge and a quick insight into advantages and limitations. They will give to your idea the touch of imagination which will vivify the whole, and they will capture for you the elusive quality of beauty.—*Building Industry*.

What is the best way to increase lime tonnage?

That is the question which is uppermost in every lime producer's mind. It will also be the keynote of the Ninth Annual Convention of the National Lime Association, which will be held at the Greenbrier Hotel, White Sulphur Springs, W. Va., on May 17, 18, and 19, 1927.

The feature of the program will be the discussion, Wednesday, May 18th, of the vital question of coordinating Promotion and Sales. This general subject will be subdivided into several phases for detailed discussion, each phase being started by a talk from a lime manufacturer who has made a special intensive study of the subject.

This "get-together" of lime producers for a full and frank discussion of the biggest problems confronting the industry will result in the coordination of policies and the development of new methods of intensive sales campaigns. It is safe to say that more real value will be derived from attendance at this convention than has ever before been realized.

Every producer of lime should make a special effort to attend, regardless of whether or not he is a member of the present organization. The meeting will be open to manufacturers at all times and every producer will have an opportunity to participate.

The program is being planned so as to be flexible and so that the maximum amount of time can be given to recreation and social activity. This has necessitated eliminating all tournaments, but it is felt that friendly groups are more desired at a convention than the keen rivalry of tournament play.

The Greenbrier Hotel offers every facility for relaxation, comfort and recreation that can be desired. The golf links are equal to any in the world; excellent clay tennis courts are available to those who prefer that sport. Well-kept bridle paths attract the horsemen, and the many pleasant, shady walks and paths around the hotel grounds and neighboring hills make quiet, easy exercise a pleasure.

Make your plans so that you can attend the National Lime Association Convention. It will be well worthwhile. You will profit in friendships renewed or made, and your business will profit through the new ideas you will gain. The middle of May is a convenient time to get away, and White Sulphur Springs, W. Va., is easy to reach with Pullman service all the way.

Every lime producer of any consequence should be represented at this meeting, May 17, 18, and 19, at the Greenbrier Hotel, White Sulphur Springs, W. Va.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

Insurance Company of North America

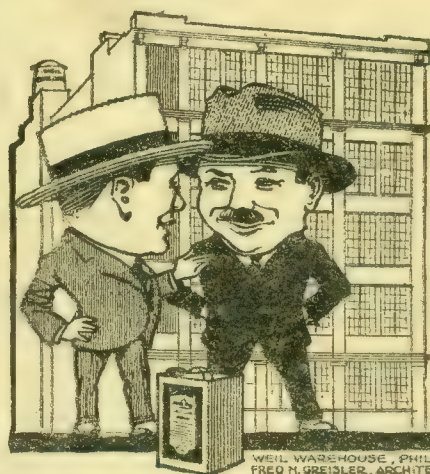

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating over-time work.

Twenty-three years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

No heating bids.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Route 7, Section 9, Adelpia-Aldrich road, Monmouth County. Low bidder: Edward H. Ellis, Wilson Building, Camden, N. J., \$309,224.10.

New Jersey Contracts Awarded

Hosiery Building, Berlin, N. J. Architect, C. H. Fries, Frankford and Oxford street, Philadelphia. Owner, name withheld. Brick, 1 story and basement, 107x131 feet, slag roof, celotex, unit steam heat, metal sash, plumbing, cement, elevator, metal toilet partitions, cabinet and mill work. Contract awarded William F. Lotz, Frankford and Oxford avenues, Philadelphia.

Theatre, Albans road and Mt. Ephraim pike, Fairview, N. J. Architect, J. Herbert Radey, 723 Haddon avenue, Collingswood, N. J. Owner, S. Levick, Bankers' Trust Building, Philadelphia. Brick, steel, 1,200 seating capacity, electric light. Contract awarded J. B. Hill, Collingswood, N. J.

Bridge, near Fox's Corner, Clementon Township, N. J. Engineer, J. J. Albertson, Camden, N. J. Owners, Board of Chosen Freeholders, Camden County, C. L. Brehm. Lengthening bridge, 10-foot span, concrete arch to be 66 feet to out. Contract awarded Hill Const. Co., Mt. Holly, N. J., \$11,900.

Market House, Absecon Boulevard, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City. Owners, Atlantic City, Louis Kiehnoe, Commissioner, Atlantic City. Brick, steel, 1 story, 180x50 feet, slag roof, concrete floors, roof ventilators, steel sash, electric light. Contract awarded to S. H. Headley, Guarantee Trust Building, Atlantic City, N. J.

Office (alts.), 42 West State street, Trenton, N. J. Architect, W. A. Kleman, First National Bank Building, Trenton, N. J. Owner, Dr. E. H. Peplow, on premises. General alterations, hardwood floors, electric work, tile and marble. Contract awarded to Harrison & Fisher, 242 Cuyler street, Trenton, N. J.

Apartment House, 311 Cooper street, Camden, N. J., \$30,000. Architect, H. E. Hall, 218 Weikel avenue, Merchantville, N. J. Owners, Sedgwin Realty Co., Camden, N. J. Brick, 3 stories, 29x96 feet, slag roof, hot water heat, electric work. Contract awarded to M. W. Cooperson, 550 Federal street, Camden, N. J.

Residences (14), 2835-61 Congress road, Camden, N. J., \$49,000. Architect, Harold A. Allen, 526 Stevens street, Camden, N. J. Owners, Bella Villa Corporation, Camden, N. J. Brick, 2 stories, 15x37 feet, slag roof, pine floors, hot water heat. Contract awarded Santi Mantini, 333 Clinton street, Camden, N. J.

Residence, 211 North Thirty-second street, Camden, N. J., \$6,600. Architect, private plans. Owner, George J. Bingermann, 13 South Thirty-third street, Camden, N. J. Block, stucco, 2 stories, 22x32 feet, slate surface roof, hardwood and pine floors, hot water heat, electric light. Contract awarded to Ashton D. Berry, Merchantville, N. J.

Residence, 759 Fairview street, Camden, N. J., \$4,000. Architect, private plans. Owner, Adolph Gall, 710 Fairview street, Camden, N. J. Brick, 2 stories, 15x45 feet, slag roof, hot water heat, electric light, pine floors. Contract awarded to B. P. Barracliff, 39 East Greenwood avenue, Oaklyn, N. J.

Residences (6), 718-22 Sycamore street and 717-21 Baxter street, Camden, \$27,000. Architect, private plans. Owner, M. Snyder, Camden, N. J. Block, 2 stories, 12x32 feet, 12x24

feet, rubberoid roof, pine floors, warm air heat, electric light. Contract awarded to Steve Waselewski, 1305 West Eldredge avenue, West Collingswood, N. J.

Building, 3151 River avenue, Camden, N. J., \$5,000. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, John Rassa, 3419 River avenue, Camden, N. J. Block, 2 stories, 35x60 feet, slag roof, hot water heat, electric work. Contract awarded to Harry Bowman National Park N. J.

Architects taking bids due May 19th.

Construction operations continue to maintain a record-breaking pace. The volume of work handled last month was the greatest ever recorded for the month of April, according to statistics compiled by the Associated General Contractors of America.

Last month's volume showed a 23 per cent. increase over the March figure and stood 10 per cent. above the mark registered for April of last year.

In addition, the total volume of operations carried on during the first four months of this year is 5 per cent. greater than the volume credited to the corresponding period of 1926.

An index which places the 1913 average on the 100 mark as its basis, shows last month's volume to have reached the 166 level. The figures for the month of April of other years are: 1921, 73; 1922, 130; 1923, 156; 1924, 147; 1925, 152; 1926, 151.

The greatest volume on record for any single month was built up in July, 1926, when the 228 plane was reached.

Only a comparatively small rise during the current month will be needed to place the mark for the first five months of 1927 well above any figure previously set during a corresponding period.

ELECTRICAL SCIENCE VENTILATES MODERN HOME THROUGH KITCHEN

Small Ventilating Fan Exhausts Odors From Stove to Outside and Keeps House Clean

One of the best ways to ventilate the home is through the kitchen.

And electrical science, after years of study and experimentation, has developed a simple little device known as an electric exhaust fan which is conquering all the formerly formidable odors of frying or cooking onions, cabbage, cauliflower, fish and other smells from the griddle as well as giving the entire home real protection from air greases and poor ventilation.

The ventilation experts declare that this little exhaust fan for the kitchen will be as commonly used and as popular among the rank and file of intelligent housewives as the electric iron, the vacuum cleaner, the automatic washer and wringer and other electrical equipment which has largely eliminated drudgery in the household. And the use of ventilation of this sort is an application in the home of the most recent developments in the electrical control of air used extensively today by big industries, in efficiently operated schools, theatres, and public buildings, the experts say.

Both physicians and engineers seem to agree that few housewives have learned to use their windows with sufficient skill and regularity to overcome the flood of smells and gases that the kitchen pours into the dining room. Window ventilation cannot be controlled with any certainty or regularity as air supply can be by electricity, it is pointed out. Ventilation should be provided for just like heating or lighting in the home and the way now is simple and the cost slight.

An exhaust fan is just a special type of electric fan which is permanently installed high up in the wall of the kitchen, in an opening provided for it, so that in operation, the fan blows the air of the kitchen with all the smoke and steam, directly outdoors and away. This sets up an immediate circulation of air from the house into the kitchen and no more smells of cooking work their way out into the other rooms. The result is that boiling cabbage or fried onions do not greet the guests at the front door while a ham may be boiled, baked, and brought up to the full point of perfection and still be a surprise to the household, when it comes to the table. The air from the house flows to the kitchen but the kitchen air can never work its way into the house.

While this little mechanical product of electrical science is a complete cure for odors, it provides better working conditions for the cook by assuring improved ventilation and less heat in the summer. The economic housewife realizes, too, that this type of ventilation constitutes a real saving to decorations, hangings and furniture throughout the house by eliminating the fumes, smoke and soot which inevitably work their way from the cookstove and gradually deposit a film of grease on everything. Dust settles and dirt clings, ruining colors, fabrics and wall paper.

The exhaust fan may be installed in any kitchen. Sometimes a square opening is cut in the wall into which the fan fits. Sometimes a section of the upper sash of a window is taken out to avoid the cutting of the wall. Often the fan is fitted into a direct flue leading from the hood over the range into the chimney. To prevent the entrance of cold air into

the kitchen when the fan is not in use, a shutter is installed that opens automatically when the fan is in operation, blown open by the blast of air. The fan need be running only about three hours a day, the engineers say.

Why the home cannot be effectively ventilated by opening windows in the kitchen is indicated by the fact that the wind may be blowing the wrong way which would rush all the cookstove odors into the house. The draught also would interfere with the cooking and chill the overheated cook. If there was no breeze at all, there would not be a particle of ventilation.

MORE LIMESTONE BEING PRODUCED BY UNDERGROUND MINING METHODS

A marked tendency toward producing larger tonnages of limestone by underground mining methods instead of by the old established quarrying practices is very evident in the United States, the Bureau of Mines, Department of Commerce, points out. In the course of six months' time during which the subject was investigated by the Nonmetallic Minerals Experiment Station of the Bureau, at New Brunswick, N. J., the number of underground limestone mining projects was doubled. Some of these limestone mines are quite large, the maximum daily production from a single mine being 3,500 tons.

The enormous and constantly increasing demand for limestone to supply a multitude of uses is a remarkable feature of the mineral industries, states J. R. Thoenen, consulting mining engineer, Bureau of Mines, in a report on the subject. As approximately 130,000,000 tons of limestone are produced annually in the United States, it is not surprising that deposits at or near the surface are gradually being exhausted and that less advantageous supplies are being worked. Quarries are becoming deeper and wider year by year, and in many places the volume of overburden that must be removed to allow open-pit work is tremendous. Quarymen are also gradually learning how expensive it is to sort and clean stone from a deposit overlain by poor material.

As such conditions confront the limestone industry, the natural tendency is to seek some modification in method whereby the handicaps of increasing cost may be met and overcome. Operators, some of them unwillingly, have been forced to conclude that underground work in drifts and tunnels is the most logical solution of the problem. The unwillingness of some is largely due to unfamiliarity with mining and to the unfounded fear that costs must increase and dangers multiply when mining is undertaken.

The advantages of underground lime-

stone mining are summarized by Mr. Thoenen as follows:

Removal of large masses of overburden is avoided.

A mine may be operated the year round, irrespective of weather conditions, thus affording steady employment to workers and promoting contentment in the personnel and a low labor turnover.

Under certain conditions storage facilities can be provided underground more easily than on the surface and without deterioration of the product. The surplus produced when the demand is slack can be stored in anticipation of peak demands.

The clean stone produced at mines often commands a higher price than quarried stone. In fact, cleaning, at considerable expense, is often necessary to make the quarried product salable. Moreover, the limestone strata in mines are not exposed to the action of frost or water or mud washed from a clay overburden.

For fluxing, mined stone is cleaner both in lump and fine sizes than quarried stone.

A mine can be advanced to property lines regardless of such factors as extent of overburden, dip of strata, cavities, and surface conditions. Moreover, mines can be worked within city limits, where quarrying might be dangerous or be forbidden by ordinances.

The disadvantages of underground limestone mining may be thus summarized:

Some means of ventilation must be supplied to carry off fumes from explosives and furnish fresh air to workers.

There is danger from falling rock.

More fines are produced than in a quarry.

The type of labor required is more skilled, and therefore more expensive, than quarry labor.

Costs are in general higher than for quarries, but the difference may be counter-balanced by the higher quality of the product.

Limestone mining is a comparatively young but rapidly growing industry. Mining methods are applicable to all deposits underlying overburden that is too heavy to be removed or handled by open-pit methods. Factors that make mining possible are the presence of enough stone to warrant the expense of development, stone of a grade to satisfy market requirements as to quality and price and also strong enough to make adequate pillars. Strong roofs formed either by the stone itself or by overlying stratum are requisite.

Various methods of mining adapted from coal-mine, metal-mine, and open-quarry practice are in use as well as combinations of all three methods. The same statement applies to the placing of drill holes. The types of equipment used

underground are much like those in use at open quarries, except that churn drills can not be used.

There does not appear to be any greater danger in limestone mining than in metal mining if work is properly planned and carefully supervised. As many quarrymen lack information on mining methods, limestone mines need more skilled men and better technical direction than quarries. Although average mining costs are higher, many individual mines operate at lower cost than many open quarries.

The choice between mine and quarry depends upon local conditions, and a decision should be made only after careful study.

Results of a comprehensive investigation of the subject of underground limestone mining are contained in Bulletin 262, copies of which may be obtained from the Bureau of Mines, Department of Commerce, Washington, D. C.

PLATE GLASS FOR WINDOWS ADDS TO HOUSE VALUE

"It has only been in the last few years that plate glass has become a possibility for the small home owner to consider in the building of his house. Formerly its price was too prohibitive, limiting its use to the larger and more costly residence.

In England this is not the case. Plate glass windows are seen in the simpler cottages of the workingman, as well as in the showy dwelling of the wealthy.

Too frequently a man, when he considers the erection of a home, consults with his architect or builder on almost every point of building construction excepting the type of glass he is to look upon and through, as long as he lives in the house. This he takes for granted, with the result that sometimes a fine grade of window glass is specified, and he is fortunate. Again a poor grade of glass is installed, which does not wear well, never looks well, and altogether goes quite a way toward spoiling the general effect of the fenestration in his home.

At the present time, plate glass may be installed in small homes at any exceedingly small cost over the value of good window glass. Some of the smaller sizes which are used in cut-up sash are sold by the plate glass manufacturers at far less than the cost of production because these sizes accumulate and have to be sold at a sacrifice. It is a wise home builder who takes advantage of this situation. Where every expense is carefully scrutinized, it should be remembered that plate glass does not have to be used in all elevations. If the cost of the home is being kept within definite limits, plate glass can be used in the front elevation only, at a trifling extra cost. One of the great ad-

vantages of plate glass is its ground and polished surfaces which give the building in which it is glazed such an elegant appearance. Cellar windows, kitchen windows and closet windows on side and rear elevations need not be glazed with plate glass. These are primarily to admit light and are not to be looked on or through.

Again, if this expense of plate glass seems too prohibitive, there is a new product on the market, another advanced step made by plate glass industry to make this type of glass possible in the small home.

This new product, which embraces one-eighth inch plate glass, affords the same clarity of vision as real plate glass. Furthermore, it has the added advantage that it can be glazed in the regular one and three-eighths inch sash without any additional sash weight being necessary. It is the same weight as the double thick window glass, and the cost of putting this in is scarcely one-half of 1 per cent. more than ordinary good quality of window glass.

Has Many Advantages

There are several advantages to be claimed for plate glass besides the undoubted superior clarity of the vision it affords and the added beauty of the exterior and interior alike.

The resale value of the house would be improved by its installation and its durability is an item to consider. Plate Glass windows are strong, and because they are so, stand shocks, high wind pressure, and the like.

Another point to be mentioned, in homes where there is a great deal of fenestration, is that, while all glass is noninflammable and a safeguard against fire, plate glass is also fire resistant.

In the interior decoration of small homes plate glass is playing an increasingly important role. One way is through the popularly called leaded glass, which suggests the rich stained glass composition which illuminates the windows of libraries, churches, and many other types of public buildings.

In colonial homes clear leaded glass of dull designs is used in treatment of windows, front doors and hallway decorations. Panel designs also come in leaded or colored glass which can be used for stair landing windows as well as in dining rooms and living rooms.

THE COUNTRY HOME

Habits and Habitation

BY RAYMOND BROOKS

Ah yet, ere I descend into the grave,
May I a small house and large garden
have.

—Cowley.

Miss Jeams had an abiding terror. We all have, more or less, some secret hidden fear that we have carried with us from the cradle, and nurture in private all our

lives. In Miss Jeams' case it was burglars. Her soul shuddered at the thought that some night she might find protruding from beneath her bed the booted extremity of a porch-climber. Even if none such were visible she could not quite gain peace of mind until she had proven beyond all doubt that he was not concealed beneath, so, nightly, she took from her sewing basket a spool of thread and rolled it under. When it came out the other side her fears were set at rest.

For thirty years this was Miss Jeams' nightly practice, and then one night the spool failed to reappear. Cold terror seized her. She almost fled, but, gathering all her courage, she essayed another spool. This one came clear. The first was but lodged, and down went Miss Jeams on two stiff old knees to find it. Then she discovered something that changed the course of her life. The bed was too low to crawl under.

If there must be a moral to the story one might say that so, without thought, are habits formed, and so they stay until something extraordinary happens to change them. Centuries may have passed before man discovered it was possible to roast pig without burning his house down for an oven. Nor is this kind of foolishness the sole prerogative of other folks

and other days. It comes to as fine a head in the modern allotment as ever in centuries before.

The suburbanite, home from the city, turns his car into the trick drive without which no suburban home is complete and proceeds to the back of the lot where he is usually obliged to back and fill a few times, keeping a weary eye on the hedge and his wife's flower-beds before he can make the garage door.

There are easier ways to do it. One might put the garage on the front of the house, or at the very least, at a slight slant so that it would not be at right angles to the drive. But does the average builder or contractor or architect waste any thought on such things? Not in the least. They are far too much concerned with appearance to think of utility, and they will probably go on for many years placing the garage in the unhandiest possible manner at the back of the lot, for the simple reason that barns before them were always built that way. That was the only sanitary place for a barn, but horse-flies and odor are not among the drawbacks of an automobile.

Which way shall a house face? Under the present arrangement the garage and the gargage can, the clothes line and all the rest of the ugly necessities are in the

back, and the best front, like the lace curtains, decorates the street. In the old days, especially in quiet towns, there may have been some reason in building the living-rooms on the road so that one might see from the windows all there was of interest or excitement passing by. But who now-a-days looks out of windows for amusement? Why not decorate our kitchen stoops as best we may, convert our back yards into gardens and enjoy their solitude? There is something, when one stops to think about it, that is not altogether pleasing or dignified, or quite well-bred about displaying all the best of one's house to strangers on the street, and sacrificing the possibilities of quiet and charming privacy for ostentation. We are merely used to that way of building, that is all,—another habit.

Perhaps some day back yards will disappear in fact and name, and gardens take their place. Perhaps the trick drive will be shortened, the garage moved to the front, and its ugly doors made attractive by good design. When this change is made the living rooms can trade the noise of the street for a garden exposure, and yield to Bridget that part of the house she would, no doubt, much prefer, where she can keep an eye out for her friend, the policeman, and the passing of the baker's cart.—*Building Industry.*

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

Insurance Company of North America

PHILADELPHIA

and the

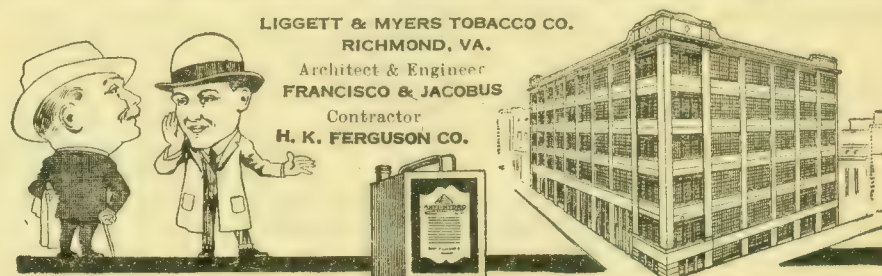

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

Fatima Cigarettes Are Made In An "ANTI-HYDRO" Waterproofed Factory

The basement in the Liggett & Myers factory was *permanently* waterproofed and dampproofed in *one operation* and at one cost of less than 1 1/2 cents a square foot by using "ANTI-HYDRO" in the one-inch concrete floor topping.

Large bales of tobacco, which must be kept dry to prevent rotting, are stored in this basement. They weigh from 600 to 700 pounds and are continually trucked over the concrete floor. Since "ANTI-HYDRO" both hardens and waterproofs concrete at the same time, it protects the floor from wear as well as water.

"ANTI-HYDRO" is easy and economical to use. Being a liquid integral agent it mixes readily with the gauging water without the aid of skilled labor. Twenty-three years of continuous use on every type of concrete work has made "ANTI-HYDRO" the accepted standard. Use it on your next job for *guaranteed* satisfaction.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Elevator Shaft, Broadway and Federal streets, Camden, N. J., \$7,000. Architect, private plans. Owner, Louis Stecker, on premises. Concrete walls, 4-foot pit. Contract awarded to Smith-Hardican Co., 1809 Callowhill street, Philadelphia.

Store Front and alts., 1115 Haddon avenue, Camden, N. J., \$2,500. Architect, private plans. Owners, Nurock & Getzov, on premises. Lowering floor, underpinning foundations, general alterations. Contract awarded to Sam Levy, 1214 Kaighn avenue, Camden, N. J.

Service Station, 68 Crescent Boulevard, Route No. 2, Camden, N. J., \$1,600. Architect, private plans. Owner, Willard Martz, 43 South Forty-second street, Camden, N. J. Brick, 1 story, 18x16 feet, metal tile roof, cement floors. Contract awarded to Adam Stephan, 3309 Pelham Place, Camden, N. J.

Residence, 873 North Thirtieth street, Camden, N. J., \$4,000. Architect, private plans. Owner, Thomas Whittendale, care of builder. Frame, 2 stories, 22x28 feet, slate surface roof, hot water heat, electric light. Contract awarded to D. H. Phillips, Oaklyn, N. J.

Building (add. and alts.), 214 Federal street, Camden, N. J., \$2,200. Architect, private

plans. Owner, Robert Turner, on premises. Frame, 1 story add., 10x14 feet, slag roof, general interior alterations. Contract awarded to Joseph D. Hill, 122 Woodlawn avenue, Collingswood, N. J.

New Jersey State Highway Work. Pennington-Woodsville road, Route No. 30, Revision of 1927, Mercer County. Contract awarded to Michael Staub, Pitman, N. J., \$250,468.

Woodsville-Ringoes road, Route 30, Revision of 1927, Hunderdon County. Contract awarded to Michael Staub, Pitman, N. J., \$322,081.75.

Route 7, Sec. 9, Adelphia-Aldrich road, Monmouth County, N. J. Contract awarded to Edward H. Ellis, Wilson Building, Camden, N. J., \$309,224.

Route 5, Sec. 18, Buttzville-Great Meadows, Warren County, N. J. Contract awarded to Union Paving Co., 123 South Twenty-first street, Philadelphia, \$358,250.

Miscellaneous Construction News

Palestra, Morgantown, W. Va. Architects, Davis, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, University of West Virginia, care of State Board of Control, West Virginia. Reinforced concrete and steel or timber, 120x380 feet, 4,000 seating capacity, saw-tooth roof. Plans in progress.

Residence (add. and alts.), Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, H. S. Schutt, 2204 Grant street, Wilmington, Del. General alterations, 2 stories add. Plans in progress.

Armory, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owners, State Armory Commission, W. E. Hoopes, secretary, DuPont Building, Wilmington, Del. Brick, stone, steel, 1 story, 180x150 feet, composition roof, dumb waiters, cut stone, cast stone, ornamental iron, iron stairs, hollow metal doors, steel sash, tile work (heating, plumbing, electric separate). Owners taking revised bids due May 28th.

Residences (2), Twenty-sixth street, Wilmington, Del., \$6,700 each. Architect, private plans. Owner, George Randman, 403 Concord avenue, Wilmington, Del. Brick, 2 stories, 22x32 feet, slate roof, hot water heat, electric work. Permit issued.

Residence, 2004 Van Buren avenue, Wilmington, Del., \$10,000. Architect, private plans. Owners, S. Cantero & Sons, Eighth and Lincoln streets, Wilmington, Del. Stone, 2½ stories, 28x38 feet, 8x14 feet, tile roof, hardwood floors, hot water heat, electric light, tile work. Permit issued.

Miscellaneous Contracts Awarded

Residence, Delaware avenue and Bayard Boulevard, Wilmington, Del., \$27,500. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owner, Mrs. J. G. Spackman, care of architect. Brick, steel, 2½ stories, 29x42 feet, 15x15 feet, tile roof, tile and hardwood floors, electric light, tile work, bond, ornamental iron work, cut stone. Contract awarded to C. J. Dougherty, 2515 West Eighteenth street, Wilmington.

Residences (8), Third street, Wilmington, Del., \$32,000. Architect, private plans. Owners, Newport Land Investment Co., 306 Industrial Trust Building, Wilmington, Del. Brick, 2 stories, 16x28 feet, slag roof, pine floors, pipeless heat, electric light. Contract awarded to Patrick Fahey, 122 North Clayton street, Wilmington, Del.

Store, 705 Market street, Wilmington, Del., \$6,000. Owners, W. T. Grant Co., on premises. Brick, 2 stories, 48x117 feet, composition roof, hot water heat, skylights. Contract awarded to J. A. Bader & Co., Lackey Building, Wilmington, Del.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., May 18, 1927. Sealed bids in duplicate will be received until 3 P. M., June 22, 1927, and then publicly opened, for the construction of the United States Post Office at Bayonne, N. J. Drawings and specifications may be obtained from the Custodian of the site at Bayonne, N. J., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

SALES ENGINEERS wanted in Eastern Pennsylvania, New Jersey and Maryland. Men familiar with architects and contractors, to estimate and sell floor covering used in public, commercial and industrial buildings.

Box 1, Builders' Guide, Philadelphia, Pa.

On and after June 1st the offices of J. Frank Clark, A. I. A., Architect, will be located at 3514 Spring Garden Street, Philadelphia. No catalogues.

Construction costs continue to hold a position higher than they reached at any time last year. Neither the average of wages paid nor the prices of major construction materials varied sufficiently during April to change the total costs, according to statistics compiled by the Associated General Contractors of America.

April was the third successive month to pass without a change in the average wage and the second during which material prices failed to show perceptible fluctuation.

The level held by construction costs last month was above the mark registered for April, 1926. A scale which places the 1913 average at 100 as its basis, shows that costs last month occupied the 201 level. The highest plane reached last year was 199, touched in May.

April figures for recent years are: 1924, 201; 1925, 200; 1926, 198.

The average of prices commanded by construction materials during March and April was the highest recorded since July, 1925. In only one month—May, 1926—has the wage average been higher during recent years than it has been since last January.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

Construction operations this year stand a fine chance to break all previous records. This is indicated by statistics compiled by the Associated General Contractors of America.

Not only have the first four months of 1927 set a mark which is well above any recorded by the volume of operations under way during a similar period in any year on record, but observations show a large amount of building is contemplated for the near future.

The volume of contracts awarded during March was the greatest ever recorded for that month. As a matter of fact, only one month—August, 1926—has reached a higher figure in the past.

The March volume of contracts awarded was 56 per cent. greater than the corresponding volume for February and 10 per cent. greater than the figure on record for March, 1926.

Special significance is being attached to these figures by experts who point to the fact that the volume of operations recorded for 1926 was the greatest shown by any previous year.

The volume of contracts awarded last month reached the 260 level on a scale which places the 1913 average at 100 as its basis.

The volume of awards made during the first three months of 1927 exceeded by 5 per cent. the volume recorded during the corresponding period in 1926.

PENNSYLVANIA REALTY CONDITIONS SOUND THOUGH BUILDING LESS ACTIVE SURVEY SHOWS

Although building permits issued in the leading cities of Pennsylvania taken as a group have shown a decided falling off this year, being no less than 18 per cent. below the 1926 record for the first quarterly period and 12 per cent. less in March, the rental situation is not unsound in the opinion of S. W. Straus & Co., nation-wide investment house, who have just completed a survey of the situation in this State. Building permits officially reported in the nineteen leading cities of Pennsylvania for the first quarter this year were \$42,275,192 compared with \$51,730,546 for the same period last year, according to the Straus reports.

"The rapid decline in building permits in Pennsylvania during the last few months, indicating the approach of a corresponding slowing up in building activities is a subject of natural inquiry," says the report. "Owing to the vast amount of money which the people both of the State and nation through S. W. Straus & Co. have invested in bond issues secured by large properties particularly in Pittsburgh and Philadelphia, we have been greatly interested in looking into the situation. While the official building permit figures reveal an unusual

decline in this State, we have found that this is largely accounted for by the slowing up in and around Philadelphia, where in some types of building there has been over production. This, however, is being rapidly adjusted to normal conditions of supply and demand through the slackened pace of operations. In Philadelphia building permits dropped nearly \$9,000,000 or 24 per cent. during the first quarter of the year. In Pittsburgh the decline was \$1,500,000 or 15 per cent. In the other Pennsylvania cities conditions are proceeding on substantially normal lines, and fundamental conditions are satisfactory.

"During the last five years we have underwritten loans in Pennsylvania amounting to \$18,490,000 secured by properties with a total appraised value of \$26,653,641 when the loans were made. These loans consist of 8 residential and 5 office buildings and commercial types in Philadelphia; 5 residential and 3 office buildings and other commercial structures in Pittsburgh.

"A survey of properties on which we have sold first mortgage bonds in Pittsburgh shows very satisfactory rental conditions. The Schenley Apartments are 92 per cent. rented; the Webster Hall Hotel is being operated on a very profitable basis and the Center Court Apartments, although only completed February 1 are 100 per cent. occupied, with an extensive waiting list of prospective tenants. Terrace Court is also 100 per cent. occupied. The entire Point Building is under lease for twelve years. The Ruskin and Ruskin Annex Building are showing profitable earnings above interest and principal charges and the same is true of the Brett Building in Altoona.

"The 1015 Chestnut Street Office Building of Philadelphia is 96 per cent. rented; Windermere Court, 94 per cent. rented; and Pine and 48th Streets, slightly less than 90 per cent. The entire Atlantic and Pacific Tea Co. building is leased for a period of ten years. The \$727,000 outstanding 6½ per cent. bonds on the Nineteenth and Spruce Sts. Apartments have been called for redemption at 102½, and a Philadelphia trust company is making a loan of \$750,000 on the property at a 5¾ coupon rate.

"Without going into greater detail along this line, we wish to sum up our investigation of conditions in Pennsylvania with the statement that in our opinion building and realty activity generally, when based upon thorough investigation of rental conditions and guided by sound judgment, should continue on prosperous lines. Certain types of building may have been carried somewhat too far in certain limited sections, and in a few cases where experience and responsibility seem to have been lacking, financial abuses have cropped out. But criticism of these in-

cidental cases should not be carried to such indiscriminate lengths that the resulting agitation tends to undermine public confidence in carefully selected and properly improved real estate and securities based thereon, probably the soundest of all forms of investment. Such agitation would ultimately have the effect of deterring builders from going ahead with necessary and warranted building improvements.

"In the financing of building operations through the medium of the first mortgage real estate bond it must be remembered, however, that only a close study of the individual property from every standpoint can determine its intrinsic soundness and desirability as security for a loan, and that the financial stability and long experience of the house underwriting the loan is also a factor that must be given due consideration by the public."

MORE EFFICIENT CONSTRUCTION

Increase the Efficiency of the Worker Rather Than Decrease the Wage

MORE EFFICIENT CONSTRUCTION is the slogan of the day among those who have done research work into construction and construction cost. This has particular reference to the matter of fabricating building material into the finished structures. An illustration of what is meant by this and the trend of the present day research is furnished by Dr. Wilson Compton, Secretary of the Lumber Manufacturers' Association, who quotes Grosvenor Atterbury, of the New York Tenement Housing Committee, as saying that today 63% of the cost of a house goes to putting the units together. That is where we get the drive on this thing of more efficient construction work. A generation ago the cost of building a house, that is the labor cost, did not represent more than 40%, the other 60% being made up of material costs. Since that time material costs have advanced considerably, but labor cost has advanced more, until today the major item of cost in the building of a home or other average structure is labor cost. Naturally, then, to hold down building costs we must figure out ways and means to reduce labor cost through some order of more efficient construction.

One theory advocated as holding out hope for cheaper housing is by the use of larger standard units, and the building of what is termed standardized houses. Mr. Atterbury is said to consider it possible to build houses of large units of concrete in about three days and at much less cost for erection than the building of brick houses. This has moved the lumber people to a study of the multitude of units involved in the material for an average home with the object in view of devising larger units and reducing the number of

these that must be fitted and fabricated to make the completed structures. Among the figures given in reviewing this subject are claims that sample concrete block houses have been reduced to about 100 units instead of the 75,000 units that appear in the same brick dwelling house including the units of supplementary building material.

Larger Units Contribute to Cheaper Construction

We have had some attention given to the theory of larger units as making for cheaper and more efficient construction in the clayworking industry. It is one of the talking points in favor of hollow tile, based on the claim that the bricklayer can lay up more wall in a day with hollow tile than he can lay with brick, because of the larger units in which the tile is made and that this contributes directly to less expensive and more efficient construction. There is an interesting point here, too, that has a lot of attention centered on it these days. And incidentally it is leading the lumber folks into efforts to cut and fit and to some extent fabricate the material for houses before it goes on the job so as to facilitate assembly and reduce the percentage of labor cost in construction. Following this idea, and the other related idea of standardizing plans and plan units it is thought practical for the lumber and millwork people to get out much of the material ready cut. And to the extent they can do this they will be able to reduce the cost of fabricating the material into the finished structure on the job. It will of course cost more to cut and fit and fabricate the material units in advance than it would to furnish the lumber in standard width and lengths just as it comes from the mill, but it is figured this cost will be less than the cost of cutting and fitting by hand on the job. Also, on paper, at least, it would serve to materially reduce construction cost on the job and that is the goal aimed at in this line of research.

The clayworking industry, and especially the brick division, is handicapped some here because of two factors. One is the rough and arduous nature of the work of bricklaying, which makes it necessary to pay comparatively high wages for skilled work in this calling to balance things up and insure enough people taking up with the calling. The other is in that so far it has been impractical to devise machines or power mechanical devices that will help here by taking on the burdensome part of the work. We have brought machinery into play a little. We have mechanical mortar mixers and we have elevators and machines and conveyors for handling the material on to the job. But so far we have not been able to provide mechanical means for taking on the burden of the hard work of fabricating brick and other

clay products into the walls, nor have we devised any striking practical means for speeding up the production per man of this kind of work. Indeed often it is the other way around, the changes in forms of construction which call for fitting in brick and tile to other structural members, such as steel framing and re-enforced concrete, makes this work more tedious and painstaking than in the past when we had plain solid brick walls. Here we have two handicap factors that furnish a problem for the clayworking industry in this drive for more efficient construction.

Permanence of Burned Clay Building Materials

To offset this we have one decided advantage, and that is permanence and quality in the material. One point named as constituting part of the hope for cheaper housing is in reducing the upkeep or maintenance. This does not help reduce the original cost but it does help in reducing the final cost and the upkeep cost. The permanence of burned clay as a building material gives it such an advantage in permanence and in lack of attention in maintenance that it justifies more in the way of original cost than where buildings are made of less durable and dependable material.

Perhaps the thing the clayworking industry needs to do is go into this matter of research study for more efficient building to find what does constitute the different items of cost, and what may be done to reduce the cost without impairing the quality and without any pinching down in the wages or compensation going to those craftsmen doing the work. The right way in efforts of this kind is, broadly speaking, not through wage cutting or curtailing the compensation of those doing the work. The right answer is to be found through developing more efficient methods so that we can accomplish more per man and that, too, without increasing the burden of work. There are two general lines to follow in seeking light here. One is that of studying waste motion and useless effort and the other is that of devising mechanical means wherever practical to take on as much as practical of the burdensome part of the work. It may not be practical for us to devise machines that will do the work of laying brick or laying hollow tile, but after all the actual labor cost of fabricating brick and tile is not the big item of cost in constructing a home or other building. Nor is the cost of the wall as a whole the major part of the cost of the home. The larger cost is made up of a multitude of details involved. It is these details we may find opportunities to speed up and improve the work of construction so as to reduce the cost. We have made some progress in mechanical mortar mixing and in the matter of handling by conveyors and elevators. Now by following through we

should be able to make other progress in other things. There is involved scaffolding and what it costs in the way of material, time and money, and there is an interesting line of research here to devise scaffolding and handling methods that will make this part of the work simpler, easier and less costly. So it is, too, with many of the other details involved in construction. There are frames to be brought on to the job and fitted into the walls, there are joists, interframing and foundation work, which involve forms. When we follow through and study each detail we may find many places to bring inventive genius into play to devise mechanical devices to help out. Also we should be able to develop through analytical study ways and means to take out waste motion and to get the work better organized and on a more efficient basis.

That is the problem before the industry, and it is up to the clayworking industry to take a part in it. It will not help or satisfy to assume and to say that the duty of the clayworking industry ends with the making and delivering of its products, and that from that time on it is the duty of architects contractors and workmen to devise ways and means to carry on more efficiently the work of construction. People in other building material lines, noticeably in the lumber industry and in cement lines, are concerning themselves seriously with this matter of more efficient construction, and by following on through and cooperating in developing the less costly construction they are promoting a wider use of their products. That is one reason why the clayworking industry cannot afford to limit its research efforts at mechanical progress to the making of product alone. It must follow on through and cooperate in the use of its products, both by standardizing and fitting the products for the best and most efficient use, and by research effort to help develop ways and means to fabricate into finished structures in the most efficient manner. And in this the industry may well go beyond the subject of the products alone. The clay products enter mainly into wall construction and the wall construction is only the outer part of the building. There are all the inner details, roofing, flooring, porches and a multitude of plan and material details involved in the modern structure, all of which count in the cost and involve work and attention. The more we can reduce the cost of these details the better are the chances to sell the public on clay products for home building. So it is up to the industry to get actively into this game of research effort to develop more efficient work on the job of construction to the end that we may progress and improve in the building industry and in the rounds promote a wider use of clay products.—*The Clay Worker.*

SELL YOURSELF AND OTHERS THE IMPORTANCE OF THE BUILDING INDUSTRY

Merchandising is the Touch-Stone of commerce and commerce lies at the basis of all civilization. There are two kinds of merchandising, one being the production of goods merely to sell; the other being the production of goods in such a manner that they build reputation and are bought readily. "Good wine needs no bush," is a proverb arising from the fact that in wine growing countries a green bush is placed in front of drinking places when a consignment of new wine is received. There are many places in front of which it never is necessary to indicate the new wine, not yet beginning to sour, is kept for sale.

The builder who laid stress during the past five or six years upon building a reputation and putting something of his aspirations and ideals into every building he erected, is reaping the fruits of his good sense. People now understand that price is a poor criterion to use when purchasing a home. The conscientious builder is a permanent member of the community. The careless builder who looks only for immediate profits is forced to go into other work.

The interdependence of all lines of work upon the construction industry is something that is sinking deeper and deeper into public understanding. The building contractor is a merchandiser primarily and, like all good merchandisers, is a buyer of many things that come into the market. He and his employees keep many factories busy. A halt in building is little short of a calamity.

The construction industry in yearly volume and money involved ranks second to agriculture in the main divisions of national wealth. In order they are as follows: Agriculture, Construction, Manufacturing, Transportation and Communications, Mining, Lumbering; fluctuations in the volume of actual construction affecting seriously all of the other divisions.

A few years ago the American Construction Council stated that out of something like four million people employed in the major industries of the United States the divisions were as follows:

Men working on field construction, 24.96%; men working upon the manufacture of construction materials, 24.96%; coal mining, 19.33%; electrical apparatus, 5.28%; automobiles, 5.26%; boots and shoes, 5.26%; men's clothing, 4.37%; women's clothing, 4.15%; furniture, 3.44%; newspapers and periodicals, 2.99%.

It was also shown that the factories of the country consumed over 40% of the bituminous coal used, and approximately one-fourth of the men employed in manufacturing industries are employed upon

materials to be used in construction.

Another 40% is consumed by railroads, one-fourth of which is estimated to be used in transporting materials and fuel for the construction industry. Traction lines and other public service companies earn a great part of their income in serving the vast number of construction workers and their families. Today construction is an even larger part of American industry than it was four or five years ago.

Each individual in the Building Industry should realize his importance in the economic life of the community in which he resides and should govern himself accordingly when talking to others not in the building trades. Give the impression that your industry occupies such an important position as has herein been set forth.—*East Bay Builder*.

Fire, which in spite of every effort now exerted is causing an increasing loss of life and property in the United States, is to be treated for the first time in history as a scourge which can be eradicated by the same scientific and systematic methods as those applied in disease plagues.

Faced by the growing economic burden imposed by fire waste, a group of prominent business leaders throughout the country are organizing a concerted attack on the fire menace designed to save thousands of lives and hundreds of millions of dollars within the next five years. A statement of the plan was issued today from the office of Irving T. Bush, president of the Bush Terminal Co., who is national chairman for a committee of representative men which is raising a fund of \$500,000 with which to finance the fight on fire.

When this fund is obtained, ten skilled fire prevention engineers will operate for the next five years wherever the local loss record indicates that fire conditions should be remedied. Supervised by the National Fire Protection Association, which has made a scientific study of fire causes for the past 31 years, these men will work through local fire prevention agencies and civic organizations. The National Fire Protection Association is a non-commercial organization which coordinates the efforts of all fire protection agencies and is independent of all special interests.

During the past two years this Association has sent out two fire prevention engineers as an experiment to determine what could be accomplished by field work. The fight against fire has been carried to eighty different localities so successfully that with ten field engineers operating under the same plan of getting cities to protect themselves fire losses can be cut down from 25 to 50 per cent within five years, Mr. Bush stated.

"Since the World War America has lost more lives through fires than were lost

in the War itself," Mr. Bush said. "We have destroyed in property during the same period the equivalent of two-thirds of the national wealth of Belgium. The damage Germany did to Belgium during the War was infinitesimal in comparison to the fire ravages we permit in America. The annual cost of fires in this country now is 12,000 lives and \$500,000,000 in property. The waste is increasing instead of decreasing, and unless we have sense enough to put a stop to this colossal carelessness we are going to impoverish ourselves sadly."

Most of the fire losses last year resulted from carelessness with matches and cigarettes, according to the records of the National Fire Protection Association. With this carelessness goes failure to protect inflammable structures. With proper construction, sprinkler systems, fire alarms, fire stop walls and other precautions fires can be checked before they cause material damage. The Association estimates that 90 per cent. of all fires are easily preventable and the other ten per cent. controllable.

"One of the reasons for the callous attitude toward fires in America," Mr. Bush said, "is the fallacy entertained by most people in respect to insurance. It is commonly supposed that fire insurance companies are the losers through fires. The fact is that fire insurance companies only distribute the losses, and premium payers actually pay them, passing the loss on where possible to the public."

"In America the per capita cost annually is \$5.00, as compared to less than fifty cents in Europe. The attitude of any community toward fire prevention is written into its insurance rates."

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—*Elbert Hubbard*.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

Many a man would do a better job if he didn't know about putty.—*Ex.*

The impractical dreamers are not the architects, but the clients themselves, as a rule.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

Insurance Company of North America

and the

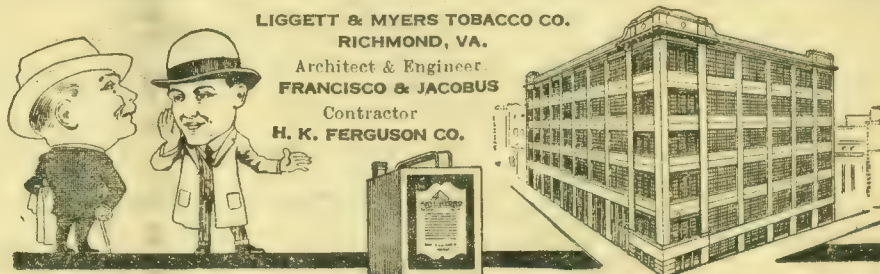

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

Fatima Cigarettes Are Made In An "ANTI-HYDRO" Waterproofed Factory

The basement in the Liggett & Myers factory was *permanently* waterproofed and dampproofed in *one operation* and at one cost of less than 1 1/2 cents a square foot by using "ANTI-HYDRO" in the one-inch concrete floor topping.

Large bales of tobacco, which must be kept dry to prevent rotting, are stored in this basement. They weigh from 600 to 700 pounds and are continually trucked over the concrete floor. Since "ANTI-HYDRO" both hardens and waterproofs concrete at the same time, it protects the floor from wear as well as water.

"ANTI-HYDRO" is easy and economical to use. Being a liquid integral agent it mixes readily with the gauging water without the aid of skilled labor. Twenty-three years of continuous use on every type of concrete work has made "ANTI-HYDRO" the accepted standard. Use it on your next job for *guaranteed* satisfaction.

SALES ENGINEERS wanted in Eastern Pennsylvania, New Jersey and Maryland. Men familiar with architects and contractors, to estimate and sell floor covering used in public, commercial and industrial buildings.

Box 1, Builders' Guide, Philadelphia, Pa.

Repetition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Purrschneids, 100 Main street, Derby, Conn.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., May 18, 1927. Sealed bids in duplicate will be received until 3 P. M., June 22, 1927, and then publicly opened, for the construction of the United States Post Office at Bayonne, N. J. Drawings and specifications may be obtained from the Custodian of the site at Bayonne, N. J., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., May 26, 1927. Sealed bids will be opened in this office at 3 P. M., June 24, 1927, for remodeling mailing platform, installing new lift, etc., at the United States Post Office, Johnstown, Pennsylvania. Drawings and specifications may be obtained from the Custodian of the Building, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

ATTACK FIRE LIKE DISEASE PLAGUE, URGES IRVING T. BUSH

With a warning that no nation, however rich, can afford such a drain on its resources as is now caused by fire in America, Irving T. Bush, president of the Bush Terminal Co., of New York, speaking before 400 prominent business men from the principal cities of the country

On the Ground When Wanted

AN ambition to give your orders the kind of attention that will THOROUGHLY satisfy you—has established us as a dependable source of supply for terra cotta.

Here are large stocks—and a REAL Service.

William H. Clausen

27th and Diamond Sts., Philadelphia

Columbia 6526-6527

Park 4981

in Chicago recently, declared that American industry must launch a systematic, scientific attack against the ravages of fire. He spoke at a luncheon given by the National Fire Protection Association which is holding its 31st annual convention here at the Congress Hotel. Members representing 146 organizations interested in every aspect of the fire problem are in attendance.

America builds annually with a half billion dollars' worth of property a funeral pyre on which are sacrificed 12,000 of its citizens, Mr. Bush said. Every sixty seconds \$1,064 goes up in smoke. The per capita fire loss in this country, he declared, averages ten times the similar loss per capita in Europe.

"And yet," he continued, "experts tell us that 90 per cent. of fires are preventable and the remaining 10 per cent. can be easily controlled. Isn't it about time we came to our senses and applied some of our American efficiency to this problem?"

The only way to combat fire, according to Mr. Bush, is to treat it as a plague, like yellow fever, and attack it exactly as medical science attacks communicable disease. He urged the use of skilled fire prevention engineers who will organize a scientific attack on fire in every community such as has already proved successful in many large industrial plants where there are serious fire hazards.

Referring to his own terminal plant, which handles one-fifth of the import and export trade through New York harbor, Mr. Bush said that when it was in its infancy four fires alone, between 1899 and 1904, caused a loss of \$1,100,000. In the 20 years since a million-dollar sprinkler system and other modern protective methods were employed, a total of 309 fires inside buildings and 305 outside caused

a loss so trivial as to be negligible. "Until 1919, or during a period of 13 years, we actually collected for damage to structures \$49, caused by the Fire Department chopping a hole in the roof," he said. "In 1920 we collected \$14,000 for damage resulting from a steamship explosion at one of our piers, the fire loss itself being insignificant.

"We will never get 100 per cent. perfection in any effort. There will always be some losses from fire in this country, but by a study of the best remedies and by teaching the people how to apply those remedies the nation can make an end to its frightful fire waste.

"In medicine it does no good to isolate the germ of some dread disease, and put it in a bottle, and look at it. Some agency must go into the field and tell the people what to do. We need field engineers to fight fire just as we need expert public health officials to check disease.

"This method is not an experiment. For the last three years the National Fire Protection Association has sent two such engineers to more than 80 cities, and their pioneer work ought to open the eyes of every progressive business man. In a number of cities the per capita fire loss was cut in half. A well organized effort in Huntington, W. Va., reduced the city's per capita loss nearly 80 per cent. There was no magic in that startling performance. First an expert engineer of the Association visited Huntington and saw the conditions; second, he told the citizens what to do; third, they did it. It is to extend this kind of service to hundreds of other towns and cities that a nation-wide campaign to raise a \$500,000 Field Service Fund is being carried on."

Mr. Bush, who is chairman of the national executive committee for the campaign, stated that the fund would finance

the operation of ten field engineers for the next five years. Many outstanding figures in American industrial and commercial life are active in the project. Mr. Bush predicted ten experts would save thousands of lives and millions of dollars in five years and would so demonstrate the value of their work that thereafter communities would gladly pay for it themselves.

One of the chief reasons for America's recklessness with regard to fire is the national delusion that "insurance people pay for fires," Mr. Bush said. He pointed out that the only function of insurance is to distribute losses and that it can no more recreate property than a death benefit can replace the person on whom it is paid.

"The man who watches a fire can be sure he is paying handsomely for the spectacle," said Mr. Bush. "The costs are all distributed to the men and industries which pay insurance premiums and ultimately to every consumer of goods. Everybody is touched to help pay the penalty of carelessness, and that is what makes fire a national problem of the first magnitude and why it must be handled systematically and scientifically on a national scale."

Mr. Bush said industry could not be content to save with one hand and then with the other throw a large part of its savings into the national bonfire. The common sense of the American business man, he declared, must lead the way in ridding the nation of the fire plague.

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

"ANTI-HYDRO" Keeps Springs of Water Out of This Building

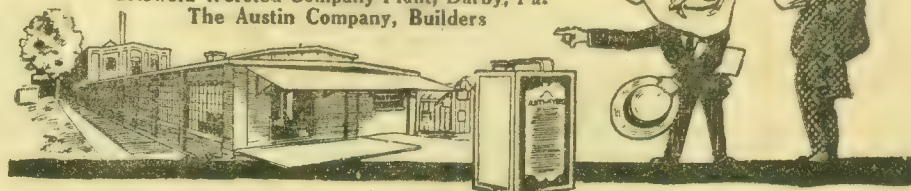

There are two underground springs under this building but the basement is always dry because the concrete foundation is permanently waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" waterproofs concrete against any head of water; it also hardens it in the same operation.

Being a liquid integral compound, "ANTI-HYDRO" mixes easily with the gauging water without the aid of skilled labor. It also accelerates the set of cement, increases its strength and eliminates finishers' overtime work.

For 23 years "ANTI-HYDRO" has been successfully used on every kind of concrete hardening and waterproofing work. Use it on your next job for permanence.

THE RELATIONSHIP OF THE ARCHITECT AND DECORATOR By ZOE A. BATTU, in the "Pacific Coast Architect"

The architect and the decorator? Here are two men who, by the peculiar nature of their work have always been vital forces in the creation of the order and balance of conditions called civilization. The one takes things—stones or what you will—of certain size and shape, definite,

sharp, quite material in themselves, and builds cities, churches, monuments, buildings, homes. In the building that which is essentially material acquires the fluid something that carries man's thought into abstract spaces; fills him with new desires and unshaped dreams. In the effort of realizing the desires—of giving form and shape to the dreams—he lifts himself to a finer consciousness mentally and physically. Thus the architect serves in the process of civilization.

The decorator follows the architect. He has, as a background for his labors, four bare walls. They may be architecturally perfect, but unadorned they are impersonal and removed from the individual—something that may move him emotionally, but that he cannot lay his hand upon. There is a cycle to be completed, a gap to be bridged in order that the occupants of a home may have an intimate relationship with its masses and spaces.

To establish a bond between a man and the four walls of his home is the decorator's function. He must give the individual things upon which he can lay his hands—books, pictures, chairs, vases, familiar objects that fuse the impersonal with the personal. The decorator, who works always in this spirit of creating a kinship between the home owner, his home and its decorative treatment, invariably succeeds in producing something more than an artistically good interior. He creates a place wherein people can live. He gives them a world of their own, peculiarly apart, but in which they can find much that brings them into closer relationship with themselves and the entire outside world. More than that, no artist can hope to do.

Thus it may be seen that the bond between the architect and the decorator is a very close one. It may be likened to the relation between a singer and accompanist. If either one plunges on without subtly connecting his part to that of the other, if either one tries to unduly dominate, the result is not music but confusion. Both may be fine and capable artists, but a joint recital must be a joint recital or he who seeks to center attention on himself ceases to be an artist. He defeats his own end by the very means that he utilizes in the attempt to gain them.

So it is with the architect and decorator. Neither can well afford to go his way without due regard for the other. Neither can afford to seek to dominate by serving effects rather than principles. For a home is judged largely as a whole. The point at which the architect leaves off and the decorator begins must never be too awkwardly obvious, or the result is a house divided against itself architecturally, decoratively and artistically. Neither the work of the architect nor of

the decorator can achieve its ultimate possibilities in such a case.

Moreover, this bond shows every indication of assuming greater proportions. In the last dozen years a gospel of good architecture and decoration has been broadcasted upon the land. Practically every newspaper, magazine and periodical in the country carries a special department devoted to the designing, building and furnishing of the home. There are a score or so of ably edited magazines of national circulation, which confine themselves to these subjects alone.

As a result of this activity of the press, the American public is no longer content with the prosaic and ordinary in homes. Nor does it have to be content with the commonplace, for, literally, the man on the street is financially able to hire an architect and decorator for his home of comparatively modest appointments. On her part, the American housewife demonstrates that even bargain basements are rich in decorative possibilities.

This interest in and general desire to acquire good homes are on the whole most desirable. They indicate esthetic and artistic interest of a practical and wholesome sort, and this condition is always more promising than indifference. But it must also be recognized that there has arisen a vast number of fads, fancies, schools, isms, schisms and what not in architecture and decoration. At some points the decorative imagination has run riot, and there are instances where we are ridiculously over-decorated. However, as we have before noted, the movement on the whole is good and nothing at which to take alarm. It presents, rather, an opportunity for the architect and decorator to clarify the main issues; to establish principles for effect; to give vigorous expression to that which is really vital and has inherent elements of endurance. As to the actual methods by which an architect and decorator can work together, there is a tremendous and almost untouched field. The ideal relationship would be for the client, the architect and the decorator to plan together from the first rough ideas to the finished home. This, however, is an ideal. It is perhaps not impossible, but as conditions now exist it would be somewhat impractical and in most cases too costly for either the architect or decorator.

But it is somewhat within the limits of possibility for an architect to keep in touch with decorators, whose abilities, tastes and temperaments enable them to complete and complement the spirit of the several architectural styles in homes. The decorator will also do well to cultivate a working contact with architects, whose homes provide an ideal background for the trend of his personal abilities and talents. Where such a contact exists, it would no doubt in many cases be possible to gain the ap-

proval of the client on some sort of co-operation between the man who is designing the house and the one who will decorate it. Such an arrangement would be to the profit and benefit of the client, the architect and the decorator.

Another method always open to the architect and one that no doubt wins the approval of the decorator is that of roughly blocking into the room sketches, units of furniture, hanging, etc. The sketches need not be elaborate drawings of exact pieces, but merely the smaller masses placed in relation to the architectural background.

The merits of the method are obvious. By making perspective sketches of the furnished rooms, it is possible to get a more accurate idea of its relationships than the best blueprint affords. Such sketches may reveal flaws in the proportions, in the placing of windows, doors and similar details, that might not otherwise be apparent until the work neared completion. The error can be corrected in the blueprint, and even though the architect and the decorator never see each other in a house so planned and sketched, the decorator receives a finely balanced and adjusted background against which to place his decorative effects. He can be truly creative and not be forced to waste his talents in attempting to conceal or minimize architectural flaws.

To this factor of mass relationships in architecture and decoration, there has been given a great deal of attention. Generally speaking, the capable architect and decorator keeps them in mind at every step of his work. Two more subtle points, which are constantly demanding that greater attention be given them, are color and texture in wall, floor and woodwork treatments. An infinite variety of wall, floor and woodwork treatments are now available. An architect with any ingenuity at all can devise effects that are both lovely and original.

However, before venturing too far with a striking and intriguing color scheme or texture treatment, it is always well for the architect and his client and the proposed decorator to shop about a bit to see if rugs, draperies and other fabrics can be found to match the proposed wall or floor finish. If nothing is available that will happily blend with the intended scheme, it had better be abandoned and something else originated. Even the design, proportions and finish of furniture in a room, where it is planned to create something special in color and texture treatment, had best be considered rather judiciously before definite steps are taken. For it will often be found that ill-adjusted color and form have a way of producing unexpected optical illusions.

Taken from any angle, the points of color and texture are illusive things—the

fine overtones and undertones of the main themes and backgrounds. Like all details they must be executed with sensitive finesse or the result is both disturbing to the senses and destructive to the entire work. Color and texture are not things that can well be decided by mere conjecture or snap judgments. Decisions can only be safely made after experimentation. So arbitrary in their demands are these two details that they practically force the architect and decorator to work hand in hand; to decorate the home while it is still in the blue-print stage.

As a matter of fact, it seems that the whole future relationship of the architect and the decorator is in the blueprint stage. This is an era in which American art standards are slowly being created. By the nature of things, the architect and the decorator are destined to play leading parts in the process, and it would appear that the two have reached a point where they will do well to merge their work to a greater degree than they have possibly done in the past. From such a merger it is difficult to say what may ultimately come.—*Building Industry*.

LIME INDUCES GREATER GARDEN YIELD

The rapid, vigorous growth necessary to both high quality and large yields of vegetables from the garden is aided by the use of lime. Practically all garden soils, particularly in towns and cities, need lime, and would be benefited by about ten pounds per 100 square feet. Any finely pulverized lime is satisfactory. Hydrated lime, used in building construction, can be obtained from the local building supply dealer, and is highly efficient on the soil.

If the soil is sour it needs liming, even if commercial fertilizers and manure are freely used, for in a sour soil the manure will not decompose readily. Then, too, lime is part of the food of plants and is essential to their growth. To that degree lime is a fertilizer, or food source. April is the best season of the year to lime gardens.

Perhaps the simplest test for the home gardener to ascertain the need of lime in the soil is to stir up a thimbleful of soil in a tumbler of clean water to which a tablespoonful of household ammonia has been added. Let the mixture stand for ten minutes, and if the liquid is a dark to inky color, the soil needs lime. If the liquid is a light straw color, the soil may not need lime, although a light application is never harmful.

When fresh manure is used, it should be plowed under to a depth of six to eight inches and entirely covered with earth. On the other hand, if the manure is well-rotted, only half should be plowed under, the other half broadcast and raked into the surface. The right time to apply

lime is after the manure has been plowed under. Broadcast and rake it into the surface.

About a bushel of lump lime thrown into the furnace after the ashes are removed in the Spring will prevent rusting of the grate during the Summer.

REASONS FOR QUANTITY SURVEYING

"Quantity Surveying," or the "Quantity Survey System" is logical and desirable. Its eventual adoption is inevitable if this country is progressing and conditions of human welfare improving, because:

(a) It results in **ECONOMY**—the conservation of physical and mental labor and its equivalent intrinsic value, by doing away with duplicated effort in preparing surveys for the purpose of making a bid. It enables the buyer to get material at a lower cost because it furnishes positive knowledge of what and exactly how much is needed.

(b) It creates **FAIRNESS** in competition and does away with special privileges for it resolves contracting to a buying and selling proposition.

(c) It encourages **HONESTY**, by exposing the facts otherwise unknown to the purchaser.

(d) It brings about **EFFICIENCY** in design. The plans and specifications are necessarily checked from a cost point of view, and corrected before being placed in the hands of the contractors.

(e) It brings **HARMONY** between the owner and contractor. The need for extras are reduced, thereby the construction proceeds on a smooth basis.

(f) It speeds the work to satisfactory **PROGRESS**, because the materials come to the site when and of the *Quality* and *Quantity* needed, through positive knowledge in ordering.

It can readily be seen that this service to the Owner will greatly reduce the cost of his construction work. To get the best results this work should be prepared by professional surveyors who are making it their life work, and paid what they are worth. The cost of surveying ranges from 25 per cent. to 50 per cent. of the cost of designing a structure.

The surveyor's fee may be paid direct by the owner, incorporated within the fees of the Architect or may be specified to be included within the contract of the successful contractor and be paid for by him just as he pays the cost of bond or insurance premiums. It should never come out of the architect's or engineer's fee.—*Architecture and Building*.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

HOME DEPRECIATION STRESSES VALUE OF BRICK CONSTRUCTION

Building bulks more largely in our national prosperity than most people appreciate. In 1925, for instance, if statistics are to be believed, one-eighth of the national income, or a sum equivalent to that amount, was spent in building construction.

Incidentally this tremendous expenditure is something the building trades unions might well consider in framing their annual spring demands for wage increases, which usually result in a season of idleness quite as disastrous to themselves as it is to the building interests.

But more important than this, by far, to the prospective builder, who is hesitating in his decision as to which type of construction he is to adopt, is the reason why so much building investment is necessary annually. The popular prediction for this year, by the way, is between six and one-half and seven billions.

According to the best authorities the wastage from structural depreciation annually on dwellings alone is about \$3,000,000,000, and that on all other buildings \$1,000,000,000. This becomes doubly significant when one remembers that about 85 per cent. of the residences in America are built of wood.

If it be a fact that \$3,000,000,000 worth of home building is necessary annually to replace the wood dwellings that are worn out and abandoned, it behooves the prospective builder to think twice before building a frame house. Especially when it is possible for him now to build of common brick, at an increased cost of less than 5 per cent., a durable home of permanent burned-in beauty, which will outlast the wood structure three times over, be economical of upkeep all its life and always of highest resale value.

—*Building Economy*.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

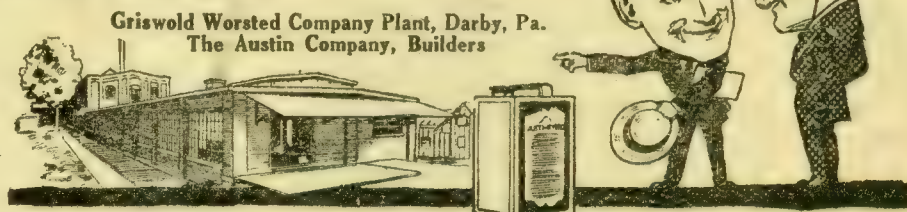

"ANTI-HYDRO" Keeps Springs of Water Out of This Building

There are two underground springs under this building but the basement is always dry because the concrete foundation is permanently waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" waterproofs concrete against any head of water; it also hardens it in the same operation.

Being a liquid integral compound, "ANTI-HYDRO" mixes easily with the gauging water without the aid of skilled labor. It also accelerates the set of cement, increases its strength and eliminates finishers' overtime work.

For 23 years "ANTI-HYDRO" has been successfully used on every kind of concrete hardening and waterproofing work. Use it on your next job for permanence.

Hotel, Corning, N. Y. Architects, Thomas, Martin & Kirkpatrick, 220 S. 16th street, Phila. Owner, American Hotel Corp., 25 W. 45th street, New York. Plans in progress, too early for details.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

Miscellaneous Contracts Awarded

Residence and Garage, New Castle, Del. Architect, W. Woodburn Potter, Real Estate Trust Building, Philadelphia. Owner, F. W. Pickard, Wilmington, Del. Stone, 2½ stories and basement, irregular in size, slate roof, pine, oak and cement floors, plumbing, flagstone, wrought iron pipe, ornamental iron work, casement windows, bond, iron pipe, rolled steel sash, tile work, metal lath, electric light. Contract awarded W. D. Haddock & Son, Wilmington, Del.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE
GROUND THAT ADVERTISING DOESN'T
PAY!

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

We'll write your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

Concrete Pits Waterproofed With "ANTI-HYDRO" are Always Dry

The concrete pits in this building, as well as the tunnel under the railroad, are waterproofed with "ANTI-HYDRO". Both pits and tunnels are always dry.

"ANTI-HYDRO" permanently waterproofs concrete against any head of water. It also hardens concrete and makes it acid, alkali and oil resisting all in one operation. Easy and economical to use, because it is a liquid integral compound, which mixes readily with the gauging water without the aid of skilled labor.

Some "ANTI-HYDRO" jobs are 23 years old, yet they look like new. That's because "ANTI-HYDRO" results are permanent. Use it on your next job for guaranteed satisfaction.

Sensational construction activity, in evidence throughout the earlier months of the year, is continuing. The volume of operations handled during May was greatest ever registered for that month, according to statistics compiled by the Associated General Contractors of America. May was the third month in succession to see new records set.

The volume of work performed during the first five months of this year exceeds by eight per cent the amount registered for the corresponding period in 1926. This is considered especially significant because operations last year reached a total never before equalled.

Last month's volume showed a twenty per cent increase over the April figure.

An index which places the 1913 average on the 100 mark as its basis shows last month's volume to have reached the 197 level. The figure for May, 1926, was 179.

Indications point to a continuation of the speedy pace already set. The volume of contracts awarded during April was the greatest recorded for that month in any year on record. The amazing spurt in the award of contracts for future work is shown in the fact that only one month on record shows a volume of awards greater than the April total.

The total volume of contracts awarded during the first four months of 1927 was five per cent greater than the volume recorded for the corresponding period in 1926.

Construction costs declined during May to a level slightly above the highest mark registered last year.

During the past thirty months, the range of fluctuation has been comparatively narrow.

The decline last month is reported to have been the result of a drop in the average of prices of basic construction materials. The average of wages paid in the principal construction centers of the

country showed no change from the position held in April. May was the fourth successive month in which the wage average has remained unchanged.

The average of total construction costs last month was exactly double the average reported in 1913. While this position was recorded at no time during 1926, more than half the months of 1925 saw costs holding a level as high or higher than the one recorded for May of this year.

The decrease in the average of prices paid for construction materials was caused by last months' lower prices for sand, gravel, stone and common brick in many localities. A scale which places the 1913 average at 100 as its basis shows the average of material prices to have held the 182 level, one point below the mark registered for April. At no time during 1926 was this level reached.

The index number for average wages paid in May was 227, a mark exceeded in only one month in 1926. It is interesting to note that changes in the average of wages have taken place only twice during the last twelve months. A slight decline last October was off-set by a small rise in February of this year.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

BRUNETTES LOSE WEIGHT FASTER THAN BLONDES

*Dark Haired Sisters Perspire Quicker
And Must Bathe More Often
Ventilating Tests Reveal*

Ancient Pompeii, smothered into oblivion by one of the wild eruptions of Mount Vesuvius, was famous for its perfumed baths because the Pompeians were a race of brunettes and nature forces brunettes to bathe more frequently than blondes, F. C. Houghten, director of the air research laboratory of the American Society of Heating and Ventilating Engineers in the Bureau of Mines here, has discovered.

"If gentlemen prefer blondes it is because the blonde is losing weight less rapidly than her sister brunette and she is burning up less tissue through metabolism," Houghten declared. "It is easier for a brunette to reduce in weight than it is for a blonde. Every human being is losing weight constantly by metabolism which leaves the body through the mouth and pores of the skin. That is why bathing is necessary to proper cleanliness and it is the most powerful argument I know of for scientific, controlled ventilation of public schools, theatres, fight arenas and other places where people gather. The ancient Pompeians knew the value of proper ventilation and bathing to health."

Physicians of the United States Public

Health Service with the aid of the ventilating engineers, the fan manufacturing industry and the United States Bureau of Mines have been conducting hundreds of physiological tests which have shown the importance of correct air conditions to health as well as the loss of weight by metabolism. It was found during these tests that the brunette perspires more than the blonde person, either man or woman. The tests established the fact that the average person loses one gram of weight per minute, although the light-haired person averaged less than dark haired persons. The weight loss was equal to one grain of corn per minute, it was explained.

Houghten declared that the pores of the skin are like microscopic caves which act just like any cave in the mountains.

"When the barometric pressure falls, which it does about twice a day, the air pressure in the cave is released and the air comes out of the cave with a rush," Houghten continued. "The point is to keep the cave cool. The same is true of the pores of the skin except on a microscopic basis and instead of the air it is usually moisture, although in very dry temperatures the moisture is unusually slight. For this reason, we lose the most weight in a hot, dry atmosphere because we work the pores overtime in this out-pouring or exudation operation."

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Concrete Pits Waterproofed With "ANTI-HYDRO" are Always Dry

The concrete pits in this building, as well as the tunnel under the railroad, are waterproofed with "ANTI-HYDRO". Both pits and tunnels are always dry.

"ANTI-HYDRO" permanently waterproofs concrete against any head of water. It also hardens concrete and makes it acid, alkali and oil resisting all in one operation. Easy and economical to use, because it is a liquid integral compound, which mixes readily with the gauging water without the aid of skilled labor.

Some "ANTI-HYDRO" jobs are 23 years old, yet they look like new. That's because "ANTI-HYDRO" results are permanent. Use it on your next job for guaranteed satisfaction.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

After a Fire

you'll find no satisfaction in figuring up the amount of insurance you should have had.

But there's a lot of satisfaction in knowing that your property as it stands today is fully covered by dependable fire insurance.

Our policies are backed by a 135 year record of obligations promptly met. Your agent or broker can get you a North America policy.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

The Concrete Pit in this Building is Below Tide Water—But
"ANTI-HYDRO" Keeps It Dry

Extreme conditions surround the sterilizing pit in this building. Unusual water pressure on the outside and acid fumes on the inside.

This pit is permanently hardened and waterproofed with "ANTI-HYDRO," which also protects the concrete from the deteriorating effects of the acid. In one operation "ANTI-HYDRO" hardens and waterproofs concrete and makes it acid, alkali and oil resisting.

Being a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the gauging water. No skilled labor is required. Results are *guaranteed permanent*.

Twenty-three years of successful use is your assurance of satisfaction. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

North Philadelphia Steps Out

THE National Bank of North Philadelphia is the first of the many progressive North Philadelphia institutions to take advantage of the rapid growth of this section.

This modern office and bank building, within a stone's throw of the intersection of Broad Street and Germantown Avenue, is just the beginning of the tremendous development which is to follow.

Stone, reinforced concrete, cut stone, steel, brick, 2 stories and basement, 72x94 feet, blue lock slate roof, tin roof, cement and pine floors, hollow tile, metal weather strip, damp-proofing, wall finish, architectural terra cotta, electric light, metal lath, tile and marble work, kalamein doors, bond, ornamental iron work, wrought iron pipe, area gratings, linotile floors, fly screens, plumbing, caulking, limestone, ornamental plaster, hollow metal partitions, painting, glazing (heating, altars, shrines, pews, communion rail, stained glass windows, interior finish of Our Lady of Lourdes shrine and floor of same reserved). Contract awarded Wills Bill Co., 1706 Sansom street, Philadelphia.

School Building No. 2 (add.), Woodbury, N. J. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, School Board of Education, Woodbury, N. J. Brick, cut stone, limestone, 2 stories and basement, 45x51 feet, asphalt roof, cement and maple floors, hollow tile, roof ventilators, bluestone, ornamental iron work, bond, tin-clad fire and hollow metal doors, marble work, metal lath. Contract awarded J. T. Allen, Woodbury, N. J., \$45,790.

Store Front, East State street, Trenton, N. J. Architect, W. A. Klemann, First National Bank Building, Trenton, N. J. Owner, S. P. Dunham, Broad and State streets, Trenton, N. J. Cut stone, reinforced concrete, steel, pine floors, electric work, tile and marble, bronze, hollow tile. Contract awarded to J. H. Morris & Co., 211 North Montgomery street, Trenton, N. J.

Service Building, Bellevue avenue, Trenton, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, Mercer Hospital, 446 Bellevue avenue, Trenton, N. J. Brick, steel, 2 stories, 58x74 feet, composition roof and floors, partitions, roof ventilators, iron stairs, casement windows, cut stone, tile and marble (heating, plumbing and electric reserved). Contract awarded to J. H. Morris & Co., 211 North Montgomery street, Trenton, N. J.

Morgue and Garage (add.), 1401-03 Princess avenue, Camden, N. J., \$5,000. Architect, private plans. Owner, Arthur H. Holl, 1401-03 Princess avenue, Camden, N. J. Brick, 2 stories, 30 feet 9 inches x 34 feet 10 inches, slag roof. Contract awarded to Edward Blizzard, 1411 Bradley avenue, Camden, N. J.

Miscellaneous Construction News

Theatre, Salisbury, Md. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, Charles A. Bailey, Salisbury, Md. Fire-proof, steel, 1 story and basement, 60x156 feet, slag roof, terrazzo floors, hollow tile, roof ventilators, wood piling, terra cotta, bronze work, ornamental iron, iron stairs, fire and hollow metal doors, steel sash, tile, marble and terrazzo (heating, plumbing and electric separate). Architect taking bids due July 15th.

Miscellaneous Contracts Awarded

Residences (6), Twenty-fifth street, Wilmington, Del., \$36,000. Architect, private plans. Owner, Max Breuer, 2601 North Franklin street, Wilmington, Del. Brick, 2 stories, 20x28 feet, slag roof, pine floors, hot water heat, electric light. Contract awarded to Dominick Cantera, 1504 Penn avenue, Wilmington, Del.

Residence (add. and alts.), Sixteenth and Brinkley avenue, Wilmington, Del. Architect, private plans. Owner, H. Rodney Sharp, Gibraltar, Wilmington, Del. Stone, 3 stories, 80x27 feet, slate roof, hardwood floors, tile work, electric light, general alterations. Contract awarded to A. L. Lauritsen, DuPont Building, Wilmington, Del.

Residence (add. and alts.), 903 West street, Wilmington, Del., \$4,500. Architect, private plans. Owners, Grace Church, on premises. Brick, 1 story add., 12x45 feet 6 inches, general alterations. Contract awarded to Heindle Samworth, Wilmington, Del.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

The wetting of brickwork for a period after laying, as often is done with concrete construction, does not add to the strength of the brickwork. This unnecessary expense and trouble may safely be eliminated.

The United States Bureau of Standards at Washington, by a series of tests, has proven that no decided increase is found in the strength of the wetted walls over those of the same type of construction which were unsprinkled.

This was a part of the most extensive tests of brickwork that have ever been made in the world. For a period of more than six months the walls have been built and crushed and in other ways tested, at the big laboratories in Washington. More than 150 large panels were built, with the greater proportion of them nine feet high by six feet wide. These represent, it is claimed, actual wall action in the average building.

Brick walls were laid 4 inches, 8 inches, and 12 inches in thickness. The 8-inch and 12-inch walls were divided between solid construction and hollow construction. A series of panels was laid in lime mortar, another in cement-lime mortar, and another in cement mortar. Four grades of common brick were used in the construction of the panels, ranging from 2,500 pounds a square inch individual test to above 6,500 pounds a square inch individual test.

Never before have authoritative tests of the results of wetting brickwork been made. The method used was to cover the panels as soon as they were completed with burlap, which was sprinkled at intervals and kept wet for seven days. After the removal of the wet burlap the panels were allowed to season about sixty days.

Opposing effects were set up in the investigation. While the dampness may tend to produce a stronger mortar, the moisture in the mortar and in the brick at the time of test weakens the wall, so that the advantages just about offset the disadvantages of wetting. The variation in strength between the walls which were sprinkled and those which were not was not great enough to justify on the part of builders the added expense for wetting.

This is only one of many important facts that have been established by the big series of tests at the government laboratories. It is expected that the Bureau will shortly issue a complete report of these tests, which will be eagerly awaited by the building industry and the architectural and engineering professions. The tests were made by the Bureau in co-operation with the Common Brick Manufacturers' Association of America.

Brickwork heretofore has been rated largely upon its performance in architectural use. It is the belief of the brick industry that the results of these tests will

greatly extend the use of the material, because they will provide the engineer and the architect with definite information upon the strength of brick walls built with certain qualities of brick under certain specifications as to mortar, thickness, etc.

TILE ROOFS ADD A VERY DEFINITE DISTINCTION

Brought from Spain two centuries ago by the valiant padres the burned clay tile has won and held a place peculiarly its own

Much of the appealing charm which delights the traveler in almost unbroken continuity throughout the Mediterranean region, and whose memories live longest and most entrancingly, lies in the architectural variations and surprises which greet him at each succeeding turn of the road. Whether it be in France, Spain, Italy, or Morocco, Algiers or Egypt; there is always the dominant motif in the type of architecture, but withal there is as well the unexpected touch of the individual taste or some boldly executed departure by the ancient designer from the conventional style of the period. For architects even in those days had their whims and preferences.

Here too was originated the roof tile which is no small factor in the picturesque architectural effects that feature this country. Here may be found tiles of a wonderful variety of oddities and shapes and of an infinitely greater variety of colors. These range not only through all those of the rainbow but, in an endless series of tints and tones, encompass about every shade that modern makers of paints have been able to duplicate down the centuries.

Spain introduced the practice of roofing with tile to the Americas some two centuries ago, through the medium of the padres who established their monasteries in the South and their missions in the Southwest. From the mother country in the earlier periods came samples of the richly colorful creations of the old masters of the craft. Few of them remain. In most instances it developed that in their manufacture was omitted something essential to their durability in the treacherous climates of the new world. Probably the fault lay in the burning, for usually they crumbled after long exposure to the changing elements.

Manufacturing the roofing type of tile was slow in gaining a foothold in the United States. It was not until shortly before the war of the states that the problem was experimented with seriously. Spanish tiles then held the highest favor and were patterned after in our earliest experiments. This type still holds first place in popular esteem although there are a wide variety of shapes made.

American ingenuity has overcome all

of the old-time weaknesses of the Spanish tile. Today it is as lasting as any other burned clay product, resists the effects of weathering, is a non-conductor of heat and cold, does not attract lightning, and is thoroughly fireproof. And in the matter of coloring, the American-made tile of today successfully rivals its old-world predecessor of a century and a half ago. And like the common brick, this is a burned-in beauty.

With the passing of the shingle roof, and this is being hurried more and more every year by municipal legislation for protection against the fire menace, the tile roof has kept pace with other substitute materials for roofing purposes. Generally tile is found in connection with masonry construction with which it develops a distinctive harmony. And especially is it fitted to the home of mixed masonry and stucco.

The affinity between the common brick and the general type of roofing tile is strengthened peculiarly by the fact that both are natural products of burned clay. Neither is artificially treated to obtain some special effect. Both come from the test of the kiln in a natural state, with purely natural effectiveness, heightened occasionally by a special mixing and tempering of the clay before the firing.

Where the vogue of some roofing materials is passing that of the clay tile with its wonderfully alluring mellowness of coloring, is yet in its infancy. Peculiarly it is a material that grows upon one. It is an urban, or perhaps more properly a suburban specialty which needs a surrounding of much greenery for the best effects. Under such conditions it thrives, and so is winning more and more friends annually.

Still under any conditions the tile roof is a thing of beauty when properly selected for color effects and harmony, especially when used in connection with a wall of common brick.—*Building Economy*.

Brick homes generally vindicate the far-sightedness of the men who build them.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

The Concrete Pit in this Building is Below Tide Water—But
"ANTI-HYDRO" Keeps It Dry

Extreme conditions surround the sterilizing pit in this building. Unusual water pressure on the outside and acid fumes on the inside.

This pit is permanently hardened and waterproofed with "ANTI-HYDRO," which also protects the concrete from the deteriorating effects of the acid. In one operation "ANTI-HYDRO" hardens and waterproofs concrete and makes it acid, alkali and oil resisting.

Being a liquid integral compound, "ANTI-HYDRO" is extremely easy to use. Simply mix it with the gauging water. No skilled labor is required. Results are *guaranteed permanent*.

Twenty-three years of successful use is your assurance of satisfaction. Use "ANTI-HYDRO" on your next job.

As The Editor Sees It

THE semi-annual report of building operations in Philadelphia for the first six months of this year, published in detail on other pages of this issue of the GUIDE, shows a decline of \$8,688,010 in total value of work of all kinds compared to the first six months of 1926.

The total value of all work for which building permits were issued in the six months ending June 30 was \$61,511,490, compared to \$70,199,500 for the first six months of 1926. The number of operations show a decrease of 584 for same period.

To June 30, 1927, permits were issued for 6255 new buildings at an estimated cost of \$54,070,015; alterations and additions, 3252 permits amounting to \$7,123,120 were issued, and miscellaneous permits, 1047, amounting to \$318,355.

The greatest decrease is noticeable in residences of the two-story type; in first-half year of 1926 \$23,582,225 was expended for this class of work; in six months of 1927, \$21,596,175, a decrease of \$1,986,050—a decline in number very slight, 4965 operations of the two story type in 1926 and 4888 in 1927 to June 30 or a drop in number of only 77, showing

that the average cost of the two-story house is materially lower this year. Residences of the three story type and the frame type show decreases in the same period.

Tenement houses show a marked increase in number and estimated cost, 35 costing \$4,507,000 in first half of 1926 and 66 costing \$8,138,500 in 1927 to date—manifesting a decided preference of the public for apartments. Manufactories declined \$2,121,075 in value with a loss of only two in quantity—40 valued at \$4,507,650 in 1926 first half year, and 38 valued at \$2,386,575 to June 30, 1927. In the period to June 30, 1927, 838 garages costing \$2,632,510 were started, whereas 906 costing \$2,616,235 were started in first half of 1926—a decline of 68 garages but an increased cost of \$16,275. Schools declined in value from \$5,422,505, the value of 9 built in 6 months of 1926, to \$3,715,450, the cost of 8 schools built in 6 months of 1927. Office Buildings show loss of 5 in number and a loss in value of \$1,036,975 in the corresponding periods. Another noticeable loss was caused by the lack of Sesqui-Centennial Buildings which in first half of 1926 increased the value of building by \$4,229,455. Hospitals increased

from 4 costing \$857,000 to 7 costing \$2,358,000.

June, with \$15,843,590 estimated value of work started, is the largest month of 1927, a drop, however, of \$1,799,155, compared to June, 1926, which was the highest June on record at Bureau of Building Inspection.

The record for the first six months of 1926:

Month	Permits	Operations	Estimated Cost
Jan.	684	1,208	\$ 7,590,755
Feb.	647	1,081	9,108,245
March ...	1,230	2,524	15,065,885
April	1,436	2,456	11,381,330
May 1,242	1,971	10,410,540	
June 1,176	1,198	16,642,745	

The record for the corresponding six months of 1927:

Month	Permits	Operations	Estimated Cost
Jan.	566	718	\$ 3,254,265
Feb.	777	1,515	7,062,930
March . . .	1,258	2,448	12,788,130
April	1,043	2,172	11,056,185
May	1,079	1,748	12,506,390
June	1,121	1,953	14,843,590

1925		1310	2304	11,156,450
1926		1176	1198	16,642,745

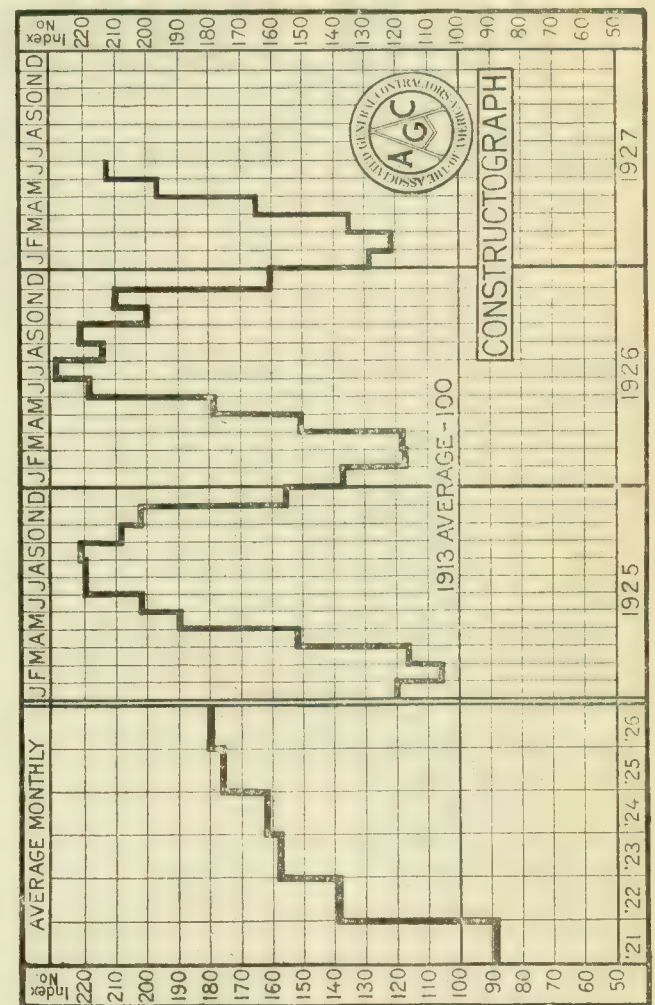

In two story dwellings the Forty-second Ward shows the greatest number started, 1477, an increase over first half of 1926 of 263. The Thirty-fifth Ward was second in the number of two-story dwellings with 1185, an increase of only four over same period 1926. The Thirty-fourth, Thirty-ninth, Fortieth, Forty-first, Forty-fifth Wards show decline in number of two-story houses started. Increases are noted in Wards 21, 22, 23, 24, 33, 38, 39, 40, 46 and 48.

The greatest volume of construction ever undertaken during the first six months of any year on record has been registered since the opening days of 1927, according to statistics compiled by the Associated General Contractors of America. Continuance of operations on a vigorous scale last month placed the total for the six-month period of this year four per cent above the figure established during the corresponding period of 1926 which held the previous record.

The June volume shows an eight per cent. increase over operations carried on during May. If even a moderate increase is made during July, the supremacy of 1927 as the greatest building year on record will be extended for another month.

Strong indications that the present record-breaking pace will be maintained are found in the enormous amount of contracts for future construction work that recently have been awarded. The volume of awards made in May was greater than any recorded for that month in any previous year. The total of awards for the first five months of 1927 exceeds

VOLUME OF CONSTRUCTION

by five per cent. the figure recorded for the corresponding period in 1926.

A scale which places the 1913 average at 100 as its basis shows the June volume of construction to have reached the 212 level. Index figures for the first five months of this year are: 129; 121; 135; 166; 197. Corresponding figures for the same months of 1926 are: 137; 117; 119; 151; 179.

The index figure for volume of contracts awarded during May is 233. The May, 1926, mark was 227.

WORTH DOLLARS TO YOU!!

No More Ashes To Lug

No clumsy pan to spill dust
and dirt on the kitchen floor

The Glenwood
Ash Chute

solves the problem. It is located just
beneath the grate and connected by a
sheet iron pipe straight down through
the kitchen floor to ash barrel in cel-
lar. No part is in sight. Not a par-
ticle of dust can escape. Just slide
the damper once each day and drop
the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new
Glenwood Idea and is very ingenious.
This is only one of the splendid im-
provements of the new plan

Cabinet Glenwood

the Range without ornamentation or fancy
nickel, "The Mission Style" Glenwood. Every
essential refined and improved upon. This
Range can be had with the latest and most
improved Elevated or End Gas Range attach-
ments. It can be furnished with fire box at
either right or left of oven as ordered. Our
handsome booklet tells all about it.

FIRE, AUTOMOBILE AND CASUALTY INSURANCE

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Fire and Marine
Insurance
Company"**

TWO MEN AND A HOTEL FIRE

Two men lost their personal effects in a hotel fire. One said: "It's a beastly inconvenience." The other said: "It will set me back five hundred bucks."

It meant inconvenience to the first one, but not financial loss. His personal effects were covered by North America Tourist Baggage Insurance. Are yours?

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

A 355,000 Gallon Reservoir in This Building Is Waterproofed with "ANTI-HYDRO" Plaster Coat

What could be more convincing of the water-proofing qualities of "ANTI-HYDRO" than the fact that a plaster coat gauged with "ANTI-HYDRO" and water permanently water-proofed the huge concrete reservoir in this building? A smaller concrete reserve tank under this same building is also waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" is easy and economical to use. It both hardens and waterproofs concrete in *one operation*. Being a liquid integral agent, it mixes readily with the gauging water without the aid of skilled labor, and insures uniformly hard and waterproof concrete, through and through. Satisfaction *guaranteed*.

Twenty-three years of continuous use have established the permanency of "ANTI-HYDRO" results. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Reinforced concrete, brick, limestone, steel, 1 story, 167x120 feet, 2 wings, 57x35 feet, composition and slag roof, cement and maple floors, hollow tile, plumbing, roof ventilators, concrete piling, waterproofing, blue-stone, metal partitions, steel pipe, steam heat, ornamental iron work, floor hardener, bond, hollow metal sash, steel skylights, metal lath, electric light. Contract awarded Forman & Putman, Marietta, Ohio.

The national construction survey just completed by the American Construction Council shows that while for the country as a whole construction activities for the first six months of 1927 may be slightly less than for the first six months of 1926, a very high volume is still being maintained. The present prospects are encouraging for a well-sustained season in building operations, with a large volume of engineering construction under way and projected.

A distinct attitude of caution prevails, a situation which in general is favorable to legitimate building construction with better construction more and more in demand. Conditions however are somewhat spotted as to volume and dominant types for various districts, each locality following more and more the dictates of supply and demand based on real needs as contrasted with the super-charged speculative building of the past several years. The hey-day of haphazard housing for both large apartments and private dwelling colonies is drawing to a close, although where there is a real need the demand is being readily cared for. The same conditions of supply and demand to meet particular needs exists for other types of building. Public buildings and public utilities tend to dominate next to housing. The smaller communities are showing special strength, both in outlying districts as well as in suburban activities.

Credit conditions on purely speculative operations have tightened considerably both as to basic financing and in extension of credit by material manufacturers and dealers, but plenty of money is available for meritorious work.

During the past winter the American Construction Council, with the co-operation of various real estate mortgage bond houses and branches of the construction industry prevented a near-crisis not only in the building industry but for business generally through what would otherwise have been, to say the least, a "bad case of nerves" on the part of the investing public toward all real estate mortgage bonds.

Materials and labor are on the whole reasonably stable though fluctuating somewhat in some localities.

The large volume of highway construction makes it increasingly important to build properly built highways so that this enormous investment of money will not suffer undue depreciation in value.

Compared with the conditions of the past several years, the building industry offers more nearly a buyer's market than has existed for a long time. This is a necessary and desirable tendency in the direction of ultimate stability of activity and character of operations which the American Construction Council has been so strenuously advocating ever since the building boom began in 1922. The respon-

sible people in all elements of the industry welcome the indications of a return to normal consideration of real building values and if this result can be accomplished without "cut-throat competition" there is no cause for undue alarm. Discrimination and not inactivity is therefore the watch-word for the building buying public.

The construction industry however is facing a period of readjustment as indicated above, which requires more than ever the need for general coordination and impartial counsel directed toward the welfare of the industry and the public interest. The importance of the work of the American Construction Council and its related agencies is becoming more and more apparent as the construction industry enters this period of readjustment.

EXHAUST FAN BIG FOE OF DEADLY MONOXIDE

Positive Mechanical Control of Air Only Insurance of Safe Ventilation of Garages, Experts Declare

Despite the fact that garage doors and windows are usually kept open during the warm days of summer, public garages should be ventilated by positive mechanical action.

That is the warning of public health authorities and automotive engineers who have been studying the effect of temperature and other climatic conditions on the deadly carbon monoxide gas which is taking a huge toll of American life.

The smaller type of garage can be made safe by use of exhaust fans, but larger garages, where numerous cars are operated, should provide a properly designed exhaust system of ducts connected to suitable exhaust fans, these authorities declare. Tests have shown that climatic conditions vary so much that vitiated air will not exhaust by natural means through vents located on the roofs. The air and gases must be driven out by fan action.

The plant engineers of such big producers as Willys-Overland, General Motors, Ford, Studebaker, Franklin and others have sent out warnings to their distributors and dealers to make it a point so see that proper ventilating systems are installed and operated in their garages and service stations. One manufacturer sent out this message:

"The repair room, where the mechanics are making adjustment of carburetor or testing engines, should by all means be amply ventilated at all times. In fact, special attention should be given to this room, to provide sufficient ventilation in order to protect the workmen properly. It is a good plan to have flexible metal hose

connections, with a series of adapters, so that the exhausts of the cars being tested may be connected to duct outlets where there is sufficient mechanical draft to expel the gases.

"During the rush periods, when the greatest number of cars are either going out or coming in, the generation and accumulation of gases become the greatest. Therefore, during these periods the ventilating equipment should be operating continuously at maximum capacity, in order to exhaust the vitiated air as quickly as possible."

Physicians of the public health service have urged that the air in all garages be completely changed at least five times every hour. This, it is pointed out, would be sufficient to dilute the deadly gases as to remove serious danger of poisoning. The use of small exhaust fans in private garages is being widely adopted since many automobile owners prefer to work on their own cars, but are frightened by the dangers of carbon monoxide.

In tests of the exhaust of a small 23-horse power automobile engine, it has been found that it discharges approximately 25 cubic feet of gas per minute, samples of which gave an average of 6 per cent carbon monoxide, or $1\frac{1}{2}$ cubic feet of the gas per minute. A ratio of 15 parts carbon Monoxide to 10,000 parts of air is considered a dangerous concentration to be exposed to for a considerable time, and the small 23-horse power engine, in "warming up" and giving off one cubic foot of monoxide, would contaminate air of a small closed garage 10 by 10 by 20 to the danger point in about three minutes. Automobile exhaust gas contains an average of from 7 to 10 per cent carbon monoxide. The quantity of the poisonous gas expelled by a cold motor is greater than that expelled by a motor already warmed up due to the greater proportion of gasoline or "richer mixture" required.

The danger of poisoning by paint in paint shops has been greatly reduced by provisions for correct systems of air conditioning while the automotive industry itself has learned to use mechanically controlled air in practically every phase of manufacture for both protecting the health of workmen and speeding up production. It has taken the aggressive lead in a national movement for better air conditions in American cities and to reduce the "sewage of air" which has been created as the by-product of industry.

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

EASY MONEY

For several years money has been made easily in the United States. This statement applies not only to the building industry but to all lines of endeavor. Effort has been stimulated by the activities of traders, men who change occupations with facility when profits appear to be greater in one place than in another.

These "fly by nights," "rainbow chasers," "job skimmers," to use a few of the terms used in speaking of these individuals, have greatly hurt the building business. They built speculatively and used high pressure sales methods in disposing of their products. Building is reaching a normal condition; but it is a larger volume than the normal of ten years ago. The speculative builders who hurt the business are going into other lines. Now is the time for reputable builders to practice daily the religion of thoroughness, good work, honest products and common decency.

Homebuyers now pay more attention to quality. Give it to them. Good service pays.—*Building Age and National Builder.*

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

TWO MEN AND A HOTEL FIRE

Two men lost their personal effects in a hotel fire. One said: "It's a beastly inconvenience." The other said: "It will set me back five hundred bucks."

It meant inconvenience to the first one, but not financial loss. His personal effects were covered by North America Tourist Baggage Insurance. Are yours?

A 355,000 Gallon Reservoir in This Building Is Waterproofed with "ANTI-HYDRO" Plaster Coat

What could be more convincing of the water-proofing qualities of "ANTI-HYDRO" than the fact that a plaster coat gauged with "ANTI-HYDRO" and water permanently water-proofed the huge concrete reservoir in this building? A smaller concrete reserve tank under this same building is also waterproofed with "ANTI-HYDRO."

"ANTI-HYDRO" is easy and economical to use. It both hardens and waterproofs concrete in *one operation*. Being a liquid integral agent, it mixes readily with the gauging water without the aid of skilled labor, and insures uniformly hard and waterproof concrete, through and through. Satisfaction *guaranteed*.

Twenty-three years of continuous use have established the permanency of "ANTI-HYDRO" results. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Repetition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

AUTOMATIC HEAT CONTROL

H. L. ASHWORTH

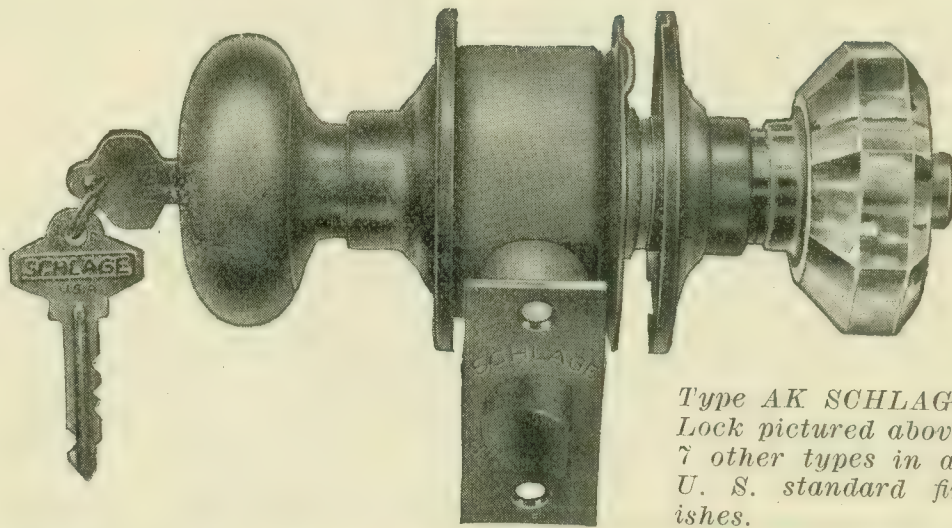

The comforts and economies to be derived by the modern American home from automatic heat regulation are fairly well known to the public, but few of us, I imagine, have any conception of the wide variety of useful functions which the thermostat performs in the business and industrial activities of the nation.

In looking over a recent report on special installations made by the Chicago branch of the Minneapolis Heat Regulator Co., this writer was amazed at the many unusual ways in which automatic

heat regulation is being adapted to commercial and industrial life.

The man whose home is equipped with an automatic heat regulator can give his neighbor a detailed description of the comforts and advantages which he enjoys through this device, but it would be difficult for him to appreciate how the same sort of equipment is likewise doing its work in stores, office buildings, factories, wholesale groceries, lumber yards, restaurants, hotels, packing plants and other business institutions.

The man who travels a great deal, stopping at hotels throughout the country, has undoubtedly often wondered why some hotels are able to keep the hot water

the MODERN lock for MODERN buildings

A factory-assembled unit-type compression-spring door lock for the price of an unassembled lock. Installed in 1/3 of the time required for other locks. Simply drill 2 holes. No screws in spindle, knobs or escutcheons. No complicated mortising. No adjusting. Does away with inside keys. Just press the button in the knob to lock inside, just turn the knob to unlock. Over three-quarters of a million already sold. No building modern without them. Complete catalog and price list on request.

at just the right temperature—not too hot and not too cold. He has found hotels where the water would be so hot one hour that it was not safe to put his hands into it, and, perhaps, in another hour water from the same faucet would be too cold for comfort. This man would not be likely to realize that automatic heat regulation is responsible for the even, just right temperature of the hot water in some of these hotels. The report referred to shows that this type of regulation for the water supply in modern hotels, restaurants and office buildings is becoming a standard equipment.

I learned from this report, also, that most factories where metal parts are manufactured are now using automatic heat regulation in connection with core and enameling ovens. The thermostat likewise performs an important function in regulating the temperature of dry kilns in sash and door factories. It is essential to coffee roasting machines and dry rooms, and to drying rooms in packing plants.

Then, getting outside of the factory and office building we find that this invention, which has brought so much comfort and economy to American home life, is likewise an essential feature in the important work of maintaining even temperature in mausoleums, green houses, cold storage and refrigeration plants. The thermostat, also, has solved many of the temperature

difficulties in connection with die casting and in the process of developing photographs. And just recently one of the large radio broadcasting companies has found an important use for it in the power plant of its station. It is widely used in piano factories and in plants where automobiles are painted and enameled.

We find that the thermostat is even being used to give temperature alarm in apple and orange orchards. Placed in the orchard the thermostat can be hooked up in a way that will sound a bell alarm in the home of the orchard owner so that he is given warning the moment the temperature drops to a point where the budding fruit trees might be in danger of frost. So warned, the orchardist can immediately begin smudging to protect his trees. More and more the automatic heat regulator is proving its worth as an economical asset to business and industry.

MORALE

Morale is a state of mind. It is marked by loyalty to an organization when it is high; by listlessness and inaction when low. When the building business was flourishing as it never had flourished the morale of the building industry was glorious. When, during the winter of 1926-27, the usual seasonal lessening of activ-

ity occurred, numbers of individuals seized the opportunity to preach discouragement. For a time the effect appeared to be to increase the seasonal depression. January showed a great falling off in work contracted for. February indicated that improvement had set in. March, April and May have shown marked increases, so that the total record to date is almost a duplicate of the record for the first five months of 1926.

Whatever may be the record for the present year it will be good. It will be far above what has heretofore been regarded as normal, if anyone really can explain what is meant by the word normal. There appear to be a number of disturbing influences at work that affect the morale of the building industry. Prominent among them is the exploded idea that cautiousness should prevail prior to a presidential election. The myth about a presidential year being a dull year was fully disapproved two years ago. To raise morale generally it is time now to reprint statistics of business during election years. Such years usually have been good.

Pessimism flourishes only during periods of low morale; optimism is the keynote of high morale. Today there is no reason for pessimism in the building industry.

TWO MEN AND A HOTEL FIRE

Two men lost their personal effects in a hotel fire. One said: "It's a beastly inconvenience." The other said: "It will set me back five hundred bucks."

It meant inconvenience to the first one, but not financial loss. His personal effects were covered by North America Tourist Baggage Insurance. Are yours?

ANTI-HYDRO Makes Concrete Garage Floors Permanently Waterproof and Wearproof

The concrete floors and foundation of this garage are permanently hardened and waterproofed with "ANTI-HYDRO". The floors are so hard that they are not affected in the least by water, oil, greases or the wear from tire chains.

"ANTI-HYDRO" has been successfully used on every type of garage from the smallest to the largest. A floor in the Automobile Club of America building in New York, where cars are washed every day, is directly over the handsomely decorated ballroom ceiling. "ANTI-HYDRO" has so thoroughly waterproofed the one-inch topping on this floor that not a single drop of moisture has ever appeared on the ceiling below.

"ANTI-HYDRO" is a time and money saver. Being a liquid integral compound, it mixes readily with the gauging water without the aid of skilled labor. Twenty-three years of continuous use guarantee the permanence of "ANTI-HYDRO" results. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., July 30, 1927.—SEALED BIDS will be opened in this office at 3 P. M., August 30, 1927, for the construction of the U. S. post office at Tarentum, Pa. Drawings and specifications may be obtained from the custodian, Tarentum, Pa., or at this office in the discretion of the Supervising Architect. JAS. A. WETMORE, Acting Supervising Architect.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

Oscar G. Orford, Architect-Contractor

ANTI-HYDRO Makes Concrete Garage Floors Permanently Waterproof and Wearproof

The concrete floors and foundation of this garage are permanently
hardened and waterproofed with "ANTI-HYDRO". The floors are so
hard that they are not affected in the least by water, oil, greases or the
wear from tire chains.

"ANTI-HYDRO" has been successfully used on every type of garage
from the smallest to the largest. A floor in the Automobile Club of
America building in New York, where cars are washed every day, is
directly over the handsomely decorated ballroom ceiling. "ANTI-
HYDRO" has so thoroughly waterproofed the one-inch topping on this
floor that not a single drop of moisture has ever appeared on the ceiling
below.

"ANTI-HYDRO" is a time and money saver. Being a liquid integral
compound, it mixes readily with the gauging water without the aid of
skilled labor. Twenty-three years of continuous use guarantee the perma-
nence of "ANTI-HYDRO" results. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

write practically every form of Insurance, except life*

**Driving Rains and Salt Sea Air Cannot
Penetrate or Stain These Brick Walls—**

**They're Waterproofed with
"ANTI-HYDRO"**

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete *permanently*. Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Garage and Show Room, Haddon avenue near Euclid avenue, Camden, N. J. Architects, Edwards & Green, Camden, N. J. Owners, Camden Motors Co., Camden, N. J. Brick, cut stone, steel, reinforced concrete, 2 stories and basement, 100x74 feet, slag roof, cement floors, hollow tile, roof ventilators, waterproofing, dampproofing, architectural terra cotta, cast stone, metal lath, rolled steel sash and skylights, kalamein doors, iron stairs, ornamental iron work, area gratings. Architects taking bids due August 25th.

Bridge, Linden avenue, over Philadelphia and Trenton Branch, Philadelphia. Owners, Department of Public Works, Bureau of Engineering, 216 City Hall. Certified check, 5 per cent. Owners taking bids due August 24th, 11 A. M. (Standard Time).

Concrete Walks and Drive, Retaining Walls, Camden, N. J. Owners, Board of Education, J. R. Given, Clerk, Westmont, N. J. Architect, C. R. Peddle, 136 South Fourth street, Philadelphia. Bettewood School and Strawbridge School. Certified check, 5 per cent. Bond. Owners taking bids due August 26th, 7 P. M. (Standard Time).

New Jersey

Contracts Awarded

Office Building, Audubon, N. J. Architect, Frank R. Watson, 1012 Walnut street, Philadelphia. Owners, Suburban Dairies, 422 Oakford street, Audubon, N. J. Brick, steel, 2 stories and basement, 101x23 feet, slag roof, composition and pine floors, plumbing, steam heat, electric light, metal lath, steel sash, bond. Contract awarded Bennett McLaughlin, 3434 Sansom street, Philadelphia.

School Building, Pennsgrove, N. J. Architect, C. R. Peddle, 136 South Fourth street, Philadelphia. Owners, Board of Education, Pennsgrove, N. J. Cement block, stucco, 1 story and basement, 60x140 feet, slag roof, hot water heat, pine floors, electric light. Contract awarded H. E. Cauley, Pennsgrove, N. J.

Grade School, Glassboro, N. J. Architects, Ritter & Shay, Packard Building, Philadelphia. Owners, Board of Education, C. H. Townsend, Glassboro, N. J. Cinder block, stucco, 1 story and basement, 56x74 feet, wing 22x36 feet, pine and maple floors, carpentry and mill work, metal lath, bond, ornamental iron work, slate and cork boards, sheet metal work. Contracts awarded: J. D.

Lawrence, Westville, N. J., \$14,694; electric, C. M. Parkehurst, Clementon, N. J., \$300; plumbing, J. A. Stanbach, Blackwood, N. J., \$977; heating, American Heating & Ventilating Co., Schaff Building, Philadelphia, \$2,300.

Residence (add.), Riverton, N. J. Architect, J. Fletcher Street, 1120 Locust street, Philadelphia. Owner, George S. Washington, Riverton, N. J. Stone, 3 stories, 3-room add., slate roof, hardwood floors, plumbing, hot water heat, electric light, tile work. Contract awarded J. E. McVaugh, Riverton, N. J.

School Building, Cinnaminson, N. J. Architect, J. Fletcher Street, 1120 Locust street, Philadelphia. Owners, Westfield Preparative Meeting, Cinnaminson, N. J. Brick, 1 story, 30x45 feet, tin roof, maple floors. Contract awarded J. E. McVaugh, Riverton, N. J.

Garage (add.) and Office, Northwest Corner Seventh and Linden streets, Camden, N. J., \$2,000. Architect, private plans. Owner, Richard McAllister, Seventh and Linden streets, Camden, N. J. Brick, 1 story add., garage, 13x75 feet, office, 12x16 feet, slag roof, cement floors, electric light. Contract awarded to Michael DeMosi, 1702 Federal street, Camden, N. J.

Miscellaneous Construction News

Type Foundry, Harrison, N. Y. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Intertype Corp., 1440 Broadway, New York. Brick, steel, concrete, 1 story, saw-tooth roof, hollow metal skylights. Plans in progress for building. Architects taking bids on grading and siding due August 24th.

Residence, Durham, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Harvey Branscomb, care of architect. Preliminary plans in progress.

Residence, Durham, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Gilbert C. White, care of architect. Preliminary plans in progress.

Residence, Newport, R. I. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, Mrs. Duncan Cameron, care of architect. Preliminary plans in progress.

Miscellaneous

Contracts Awarded

Residence and Garage, Scarsdale, N. Y. Architects, W. W. Slack & Son, Trenton Trust Building, Trenton, N. J. Owner, Mr. G. Burlengame, care of architects. Frame, 2 stories, 36x26 feet, shingle roof, hardwood and concrete floors, hot water heat, electric light, tile work. Contract awarded to A. Borgeson, Sprague avenue, Scarsdale, N. Y.

Garage (add. and alts.), 701 West Fifth street, Wilmington, Del. Architect, private plans. Owner, William Lank, 1401 West Sixth street, Wilmington, Del. Brick, steel, 15x58 feet, slag roof, cement floors, electric work. Contract awarded Patrick Fahey, 122 North Clayton street, Wilmington, Del.

Store, 519 King street, Wilmington, Del., \$6,500. Architect, private plans. Owner, James T. Mullen, Sixth and Market streets, Wilmington, Del. Brick, 1 story, 14x94 feet, slag roof, pine floors, electric work. Contract awarded H. S. Lynch, 715 Tatnall street, Wilmington, Del.

Apartment (add. and alts.), 604 West street, Wilmington, Del. Architect, private plans. Owner, Daniel Negro, on premises. Brick, 18x27 feet add., general alterations. Contract awarded H. S. Lynch, 715 Tatnall street, Wilmington, Del.

LET'S COOL THE FACTORY

By SAMUEL R. LEWIS

Chairman, Research Committee, The American Society of Heating and Ventilating Engineers

(Reprinted by special permission from *Factory*, the Magazine of Management.)

Whatever practical method may be adopted for cooling the factory, it must follow Nature's own cooling cycle. Nature cools by evaporation, and even our modern refrigeration plants are an adaptation of that principle.

It takes heat to evaporate a liquid, so naturally when a liquid evaporates heat is absorbed from the surface nearest the water. Thus we see the dew on the sur-

face of green things in the mornings. When the sun went down the night before and ceased to furnish radiant heat, the air became cooler and consequently contracted in volume. It was thus no longer able to carry its full burden of moisture and laid it down on the leaves and the ground.

There are many nights when the temperature of the air is above freezing, but following which we can see white frost everywhere. I believe that on such nights the frost does not appear until near morning, perhaps at sunrise, when the air begins again to pick up its burden of moisture. The evaporation on the immediate surface of the leaves causes the freezing.

In this cycle, from a vapor to a liquid, we have the fundamental basis for all refrigeration and artificial ice-making. From the great coolers at the packing-houses to the little machine under the pantry ice-box, all refrigerations use the same idea. All compress some gas into or toward liquid form, using heat or its equivalent mechanical energy. The heat which always accompanies compression can then be removed by cooling the gas container with streams of air or water. Then as the compressed gas at normal temperature expands in a reducing valve, it absorbs great amounts of heat from its surroundings.

Every automobile tire is a miniature refrigerating plant. When it is pumped up by hand, not only does the person at the pump get warm, but the pump itself gets quite hot, and the tire itself becomes appreciably warmer. When the tire again attains its normal temperature, if the valve is unscrewed permitting the air to escape, there is a decided drop in temperature near the orifice as the air regains its heat in expansion.

It is evident, then, that a building may be cooled either by simple evaporation of water or by the mechanical process of completing the cooling cycle.

When mechanical refrigeration is used, cooling the air is relatively easy, but the cooling is always accompanied by the difficult and expensive necessity of removing the moisture or dew which always goes along with reduction in air volume. Thus, when we refrigerate a fur-storage vault, for example, ice accumulates on the refrigerating pipes, which soon become self-insulated. Sometimes this ice is broken off by hand and carried out. More often the room is allowed to warm up quickly, sufficiently to melt the ice, and the accumulated water is drained off before it can be reabsorbed by the air.

The best method, however, is to cool the room by indirect refrigeration. Most modern air-cooling systems operate on this indirect principle. In such a system the room is cooled by cooled air circulated through the room by fans. The air is cooled by contact with a spray of chilled

water, which flows over the refrigerating pipes. Since the water is much colder than the air, it is gradually increased in volume as it absorbs moisture from the air, yet, since it is water, not ice, it keeps the cold pipes from insulating themselves with frost.

The use of water-absorbing materials, such as salt of calcium chloride and other water-hungry materials, for drying air to prevent this frost, has not been commercially successful, since the change from a vapor to a liquid inevitably liberates heat.

The most successful method, therefore, for applying artificial refrigeration to air-cooling, requires a water-spray, a fan, a recirculating pump, and a system of distributing ducts.

Nature's method of cooling overheated animals is based on the evaporation phenomenon. Animals have pores in the skin which exude moisture. The moisture evaporates in the moving air, and the body is cooled. We can take advantage of the evaporation effect also in factories.

A stone house, having no damp-proofing in its walls to prevent carrying up ground water by capillary attraction, is always a cool house in warm weather—despite its bad reputation otherwise—because of the constant evaporation.

A factory in Buffalo has an exterior water-curtain which is used to wet down the walls and roof for fire-protection. It has been found that a great cooling effect in hot weather comes from wetting down the walls of this factory occasionally, even though the water may be very warm.

Another method of cooling by evaporation is to build the roof so that it will hold a shallow pool of water. The evaporation of the water in warm weather cools the pond and the rooms below.

The olla, a porous drinking-water jar and an institution in southern climes, cools the water to a refreshing degree by this same evaporation effect.

Although in this article we have been considering the evaporation phenomenon as an agent for cooling a building, we must not forget Nature's own method of applying evaporation cooling directly at the body. We can aid body evaporation by keeping the air in rapid circulation with fans, giving us a third method of cooling.

However we may cool the factory though, we must, if we expect satisfaction, arrange to prevent too rapid re-absorption of heat after the cooling has been effected. We would not get very far in cooling the butter and milk in the pantry machine unless we had a good ice-box.

The factory should, therefore, be a warmly built structure, capable of reflecting the radiant heat of the sun and of keeping out the heat. Such construction,

of course, is a great factor in keeping the winter heat in.

Dry wooden walls, built without hollow wall spaces, are excellent heat insulators. Hollow spaces between the building studs permit local interior air circuits, which carry heat from one side to the other. The currents increase as the height of the space is increased. For the most effective heat insulation, therefore, there should be no such local air currents. They can be prevented by filling the space with porous fire-proof materials, several of which are available commercially. Spaces between rafters should be closed similarly, for the insulation will give much cooler attics and top stories, as well as materially reducing coal consumption in the winter.

A New Way to Cool a Building

Recent observations with the Nicholls heat meter of the American Society of Heating and Ventilating Engineers have proved the effectiveness of another method of cooling a building. On a warm, sunny day the dark-colored roof on the United States Bureau of Mines at Pittsburgh absorbs heat very rapidly from outside. It was found, however, that if the roof were covered with a light-colored paint or cloth, the heat inflow ceased, while heat actually flowed back outside from the attic. This flow of heat was noticeable some little distance away from the hot roof.

It is calculated that a light-colored or light-reflecting roof surface would reduce the inflow of the sun's heat by some 40%, with a roof having otherwise the same heat-resisting qualities.

The fact that cold air is heavier than warm air materially affects the installation of any mechanical cooling system. If the air inlets and outlets are both at the floor, the cool air crosses the floor from inlets to outlets, and the hot air stays up above it, little affected by the process. If the air inlet is at the top and the outlet at the floor, the cool air falls to the floor, and unless very carefully diffused with many well distributed inlets and outlets, it still will short-circuit.

If the inlet is at the bottom and the outlet is at the top, the warmer air constantly will be withdrawn and the room gradually will cool off. If, however, there are any open doors or windows, the cool air will fall out through them like so much water, and the upper part of the room will be warm. Thus a basement which is reached only by stairs from above is usually a cool basement. It is easy to refrigerate such a room. When we cool a multi-story building, however, with dry cold air, we need tight doors at every story around all stairs and elevators, or we have one grand room comprised of the whole building, cool at the bottom and hot at the top.

Refrigerated buildings always should

have double windows, and vestibules or revolving doors, for at every opening great quantities of relatively cool air are lost.

Observing the few simple rules of heat insulation and reflection when constructing a new building will assure a much more comfortable housing in hot weather, and even old buildings can be insulated. This insulation may largely eliminate the necessity for expensive air-conditioning apparatus. However, when production depends on employees' efficiency, the investment for a capable cooling system may soon be returned in increased production, greater satisfaction for employees and a better product as a result.

POOR ARCHITECTURE LAID TO BUILDERS

David Tishman Says That False Economy Destroys the Architect's Best Efforts

NO LACK OF GOOD TALENT

Only \$12,000 Difference Between the Cost of a Beautiful and an Ordinary Structure

By DAVID TISHMAN

Vice-President of Julius Tishman & Sons, Inc.

In the light of the growing tendency, especially noticeable during recent years, to erect buildings severely plain in design and lacking proper architectural treatment, it is inevitable that there should have grown up a school of dissenting opinion as to the beauty and fitness of such buildings in the scheme of New York's physical development.

To whom should we attribute this condition, which in the minds of many thoughtful and influential men, is fast approaching a status where it calls for earnest consideration? The architect? Frankly, I do not believe the responsibility can be laid at his door. He is professionally responsible for the effect, but is not personally responsible for the cause.

There are no finer architects in the world than those of America. Public buildings, Churches, Cathedrals, private residences, hotels, apartment and business buildings are about us to tell us every minute of the day of capabilities of the architectural profession.

No one should appreciate the desire and ability of the architect to design buildings of beauty as well as usefulness more than the man whose business is that of building. In our own organization, during a period of thirty years we have come to realize to the full the logic of having

the architect design buildings that will best meet the purpose for which they are intended, and at the same time stand as monuments to architectural taste. It is the inclination and habit of mind of the architect to create the beautiful, just as is the intent of the owner and builder to erect structures that will best meet the needs and comply with the standards of those who are to use them. Where the result of an architect's work is reflected in a building that apparently indicates a lack of appreciation of the place and importance of proper architectural treatment, it is probable that he was compelled to design a building to order not only in its interior planning, where the owner is presupposed to know what is best, but in its exterior, where the owner can and too often does not impose unwise restrictions, both physically and financially.

It costs but little if any more to design a building that is pleasing to the eye than it does to design one lacking proper architectural treatment. To illustrate this truth, I might draw a comparison between the cost figures on a fourteen-story building erected in the style of the all too frequent unreliable facade.

This comparison shows that it would have cost the builder a matter of only \$12,000 additional to have produced a building that would have been as desirable architecturally as it is practical and well planned. Twelve thousand dollars, as compared with the hundreds of thousands of dollars that the completed building cost, makes the difference an almost insignificant one.

But it marks the difference between a building designed to an owner's orders who thought only in terms of its commercial fitness, and a building that would have gained considerably in its artistic value had the architect been permitted to exercise his artistic sense as well as his planning skill.

The subject of the external architecture in the business and residential buildings of New York City I believe to be of more than passing importance to the city at large. The initiative of the men who are financing and building our modern business and residential structures carries with it a responsibility to our city as well as to our next-door neighbors. We either are contributing to New York's worldwide reputation as a metropolis of splendid buildings that are at once a pleasure to the eye and a tribute to perfection in usefulness and utility, or we are erecting buildings that are so mediocre in their external physical aspects that they are a detriment to the city.

The visitors to our shores never cease to marvel at the building line of New York City. Whether their expressions of opinion come as they steam up the bay

and glimpse lower New York, with the Woolworth Building, the Singer Tower and the new American Telephone and Telegraph Company Building rearing their wonderful masses against the sky, or whether their appreciation results from a closer inspection of our great uptown Park Avenue section, or from a drive along Fifth Avenue or Riverside Drive it is a fact that this appreciation is all too often tempered with regretful comment that there are so many individual buildings that stand to disturb the harmony of beauty and dignity.

Matter-of-Fact Acceptance

We who live in New York accept our city as a matter of course. The miracles of building during the past decade have been so many that the man in the street comes and goes with hardly more than casual note of the structural marvels that are happening before his eyes. But each new building, whether it is only of neighborhood importance or whether it is of wider significance, I firmly believe should be an expression of good architecture. That does not imply extravagance by any means. It does not imply that every building that is erected must be a 100 per cent exposition of some school of architectural thought. It does not mean that the owner of a building intended for business should be compelled to rear a classic temple.

On the contrary, as one who has been so closely identified with the building of metropolitan structures, residential and business, I believe that the owner should have the fullest possible sway within the limitations of sound building practice, as to the kind of a building he may erect; and by the same token, he should be held strictly to account to erect buildings that will be as representative of high standards of taste externally as they are examples of fitness within their four walls.

No seeing man who raises his eyes above the level of the sidewalks can be blind to the all too many examples of buildings in important locations that are so utterly lacking in architectural beauty that they are quite properly subject to criticism. Who is to blame? The architect? With exceptions, I do not believe he is.

I venture to say that we, as investing builders, know perhaps as much as, if not more than, the architect, as to what the future tenants of the buildings we erect will expect to find in them in arrangement and facilities. The thousands of people who have leased space in our buildings have given us an education in what to incorporate or omit in our buildings that very few architects could hope to match. But when it comes to the outside of our buildings we defer to our architect.

Company"

PERSONAL POSSESSIONS

have an insurable value
all their own

It will cost you a very small amount
to insure against loss of personal effects
in transit, in club locker rooms, hotels
and public places—anywhere outside
your home.

Ask your agent for information about
North America Tourist Baggage Insur-
ance. You need not be a tourist to
benefit by this protection.

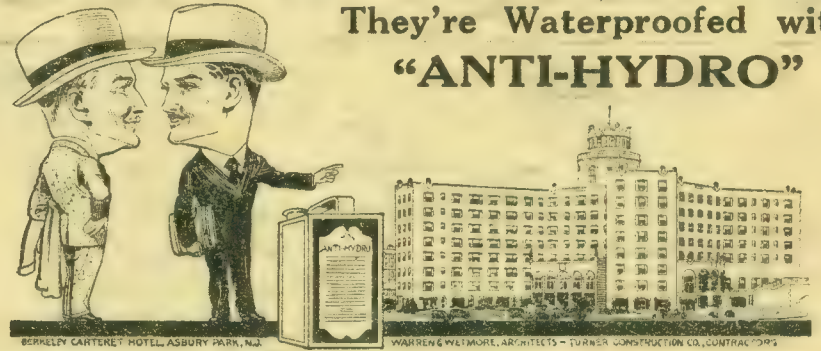

**Insurance Company of
North America**
PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

**Driving Rains and Salt Sea Air Cannot
Penetrate or Stain These Brick Walls—**

**They're Waterproofed with
"ANTI-HYDRO"**

Although this large hotel is situated on the ocean front at Asbury Park, New Jersey, the walls are always dry and the brick cannot stain from efflorescence coming from the mortar joints. That's because the cement mortar is mixed with "ANTI-HYDRO."

Driving rains, wintry winds and salt sea air have no effect on this masonry.

"ANTI-HYDRO" waterproofs and dampproofs portland cement mortar, and concrete *permanently*. Its small additional cost guarantees dry and stainless walls and is a profitable investment for any building, large or small.

Being a liquid compound which mixes readily with water, "ANTI-HYDRO" is extremely easy and economical to use. No additional labor is required for the mixing. And in addition to its many other advantages, "ANTI-HYDRO" makes cement mortar extremely plastic so that it spreads more easily. Use "ANTI-HYDRO" for your next brick job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., August 18, 1927.—Sealed Bids will be opened in this office at 3 p. m., September 15, 1927, for interior changes at marine hospital, Buffalo, New York. Drawings and specifications may be obtained from the custodian of the building, or at this office in the discretion of the Supervising Architect. JAS. A. WETMORE, Acting Supervising Architect.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

BETTER CONSTRUCTION

It is interesting to note a persistent drive on all sides for better construction. The Associated General Contractors at their recent annual meeting discussed among other things the question of routing the irresponsible bidders and promoting the interest of responsible and dependable contractors who expect to do the right kind of building. Meantime the lumber interests, building and loan associations and others engaged in financing building operations and making loans on structures have been actively concerning themselves with getting a better order of construction so as to have actual value in the structures and not merely a semblance of it in outside appearance. There is a general and concerted drive to weed out cheap, flimsy construction, and to get more of quality and permanence in the building work of the day. This is not only good sound reasoning from the viewpoint of the general public, but it should make a special appeal to the brick and hollow tile people because it makes opportunities for a more extensive use of these products in construction. That great advertising slogan, "Build with Brick," was founded on the idea that it could be easily demonstrated that the slogan if properly followed meant better and more permanent construction, and in the final analysis economical construction. Quality and permanence have been the foundation of the claims for recognition in the clayworking industry right along. So the industry as a whole should join heartily in the drive for better construction. And even in the use of its own products insist upon including the idea of quality and permanence in structure rather than strive for a little saving in first cost by the use of thin walls and less material than really should be included in construction. In short, the clayworking industry should be leaders in promoting and demonstrating the idea of better construction.

NATIONAL CONSTRUCTION EXPOSITION

January Demonstration Center for General Construction Materials and Methods Announced by the Associated General Contractors of America

The Associated General Contractors of America, representing 2,300 general contracting firms, with headquarters in 40 different States will hold a National Construction Exposition in the West Baden Springs Hotel, West Baden, Indiana, January 23-27 next, according to plans announced August 1st, by Gen. R. C. Mar-

shall, Jr., of Washington, General Manager of the Association.

Every important method used throughout the general construction industries will be shown in a series of exhibits which will demonstrate all types of construction materials, supplies and accessories for industrial, engineering, governmental, transportation and specialty building projects, it is forecast. It will be exclusively a construction man's show, inasmuch as there will be practically no general public attendance. Every visitor will be registered and identifiable.

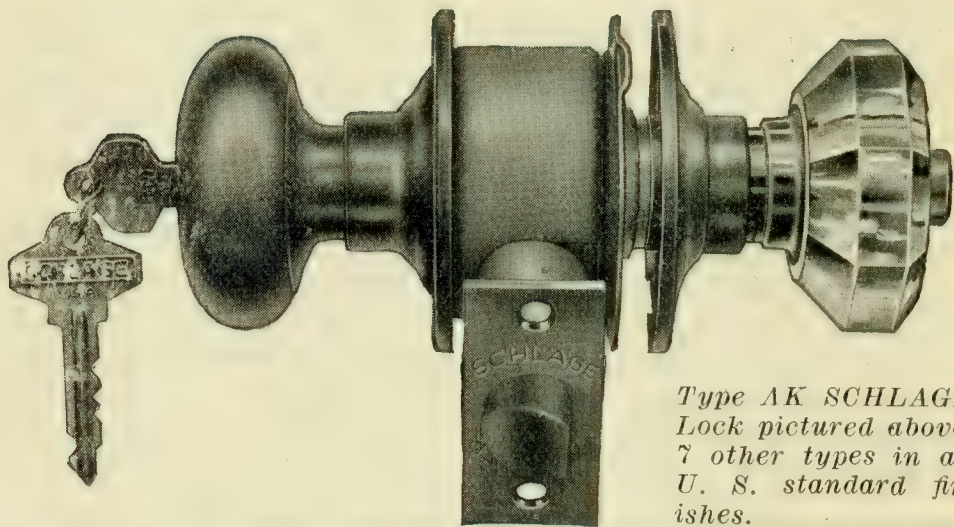

Awards to Best Displays

Exhibits will be prepared by many of

the leading construction materials and supplies companies of the country, it is announced. First, second and third awards will be made by the Associated General Contractors of America, through a special committee, to the companies having displays adjudged the most effective.

The Exposition will be held in conjunction with the ninth annual meeting of the association, and is a response to requests by a large number of important materials and supplies companies for adequate and officially recognized construction display facilities.

The policies and conduct of the Exposition will be in every phase subject to control by the association, the design of

Type AK SCHLAGE Lock pictured above, 7 other types in all U. S. standard finishes.

which is that the show shall fulfill in every sense the implications of its title, by providing a national and authentic demonstration center for all general construction utilities. Exhibiting companies' representatives' participation in all convention sessions will be encouraged.

The Exposition will be held in the large circular, skylighted "Atrium," itself a constructive novelty, of the West Baden Springs Hotel. Association sponsorship and control of the Exposition and the unique arrangement of convention, Exposition and guest facilities at West Baden, the announcement points out, will combine to give the Exposition a unique character, in that:

Unusual Acquaintance Stimulus

"The West Baden-French Lick vicinity is a self-sufficing, non-urban (although equally non-rural) locale, every feature of which tends to friendly contact. At meals, in diversions, in sports, as well as in the Exposition and convention activities, there will be an inevitable and agreeable intermingling which will result in a closer knitting of acquaintanceships. Those in attendance will be all directly interested; and, in a physical sense, the Exposition, occupying the very center of the hotel, will be the actual axis of their daily movements. In the distinctive quality of its attendance, and in the peculiar

and advantageous contact by exhibitors with the individuals of this attendance, the Exposition might be called a 'business house party.'"

General executives, technical staff men, purchasing executives and superintendents of general contracting companies, non-members as well as members of the Associated General Contractors of America, will comprise the individually identified, directly interested attendance at the Exposition.

The announcement of the Exposition asserts that: "this attendance will be, in effect a roster of America's general construction leaders. The construction activities for which the general contractor is normally a purchasing determinant, include practically the entire range of large scale governmental, industrial, and residential development and individual improvement projects. Many of the companies which will be represented among interested visitors, operate on a continental and some on an international scale.

A \$2,300,000,000.00 Field

"The most recent inclusive figures available—for 1925—indicate that the volume of operations of the membership of the A. G. C. of A. alone reached \$2,294,000,000 in a year. Construction today is America's second largest industry-

being exceeded in volume of operations only by agriculture."

The show will open officially at 9.30 A. M. daily. Official evening closing hours will vary in accordance with the entertainment program of the Association. Installation of displays will begin Friday, January 20th. Dismantling will take place at a sufficiently early hour to allow exhibitors' representatives to leave late Friday evening, January 27th.

Exposition Office in New York City

The general office of the Exposition is at 225 West 34th Street, New York City.

The convention with which the Exposition will concur will be the ninth annual meeting of the contractors' national organization and will be attended by delegates from virtually every State. Record-breaking construction activities this year will develop many problems in the construction industry to the point where they will demand extensive attention, it is being pointed out. These problems include misuse of lien laws; promiscuous issuance of surety bonds; accident prevention and construction of public projects without use of the competitive contract system.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

Acids Do Not Harm these Concrete Floors—

L. A. Dreyfus Building, Rosebank, Staten Island, N. Y.

Turner Const. Co., Engrs. & Contra.

They're Protected with "ANTI-HYDRO"

The concrete floors in this building are constantly covered with
acids and water which would quickly deteriorate them if they were not
hardened and waterproofed with "ANTI-HYDRO."

Although these floors have been in constant use for many years,
"ANTI-HYDRO" has fully protected them from wear, water and the
action of the acids.

"ANTI-HYDRO" is a liquid integral agent that mixes easily with
the gauging water—no skilled labor is required. It hardens and water-
proofs concrete and makes it acid, alkali and oil-resisting all in *one*
operation.

For 23 years "ANTI-HYDRO" has been the accepted standard. Re-
sults are *guaranteed permanent*. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., August 24, 1927. Sealed bids in duplicate will be received until 3 p. m., September 21, 1927, for additional stories and work incident thereto of the United States Liberty Loan Building at Washington, D. C. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. JAS. A. WETMORE, Acting Supervising Architect.

THE ETERNAL TRIANGLE IN THE BUILDING INDUSTRY

By RUSSELL GUERNE DE LAPPE, *Architect*

The eternal triangle in the building field comprises three members: The owner, with his project and the desire and money to finance it; the contractor or contractors, able and capable to assemble the materials and direct the craftsmen and labor throughout the execution of the work, and the architect, whose translation of the idea into working drawings and contract documents, whose position as accountant and overseer, completes this three-member partnership.

The overlapping in these fields invariably leads to loss, misunderstanding and friction. An owner, without funds, pressing a flimsily financed project, secures an incompetent, cheaply-obtained architect, to delineate misprepared plans, incomplete specifications and faulty documents, rendering no service as supervisor over the accounts or the work. These documents are placed in the hands of greedy, foolish contractors and at once is begun a building "flop."

The owner without finances is a menace to the building fraternity. The architect credulous enough to be duped into rendering less service for less fee, is likewise a menace, and the contractor or contractors undertaking the performance of such work are certainly greedy, if not foolish. Such a picture can carry the inscription "disaster."

View the other picture: The intelligent, ambitious, creditable owner, who realizes the possibilities of his property under a certain development program. In expecting nothing for nothing he first

arranges his finances. He is master of the situation, can pay for the obligations he assumes and with clarity of mind entertains the furtherance of his program. His architect, a trained man, versed in building, proficient in design ability, practical in his procedures, prepares a series of studies and schemes for the future building. Various possibilities are exhausted and a final solution accepted. Then the working drawings, specifications and other contract documents are undertaken and completed.

These are the tools necessary for the contractor or contractors to have, from which their estimates and calculations are made. The architect is morally obligated to the building trades to give them as clear and comprehensive a set of such documents as he is able to give. He cannot do so when he is underpaid.

The building program has materialized and the project is started; ground is broken and the noise of construction is heard. The building is to be no better than made possible through the funds available nor any better than the drawings prepared, and certainly none better than the ability and craftsmanship of the men completing the contracts. Such intimate relationship as required in every building project between the owner, architect and builder assuredly calls for the closest co-operation between each member of this triumvirate.

The example set by established, efficient institutions is worthy of emulation. They do not undertake to build without funds, nor do they secure a set of plans free. They do not permit hod carriers to do plastering, or in general, require everyone to perform everyone's else duties. Their procedure is quite direct and definite because it is most economical. The success of their project depends on their judicious selection of the right man to perform his respective duties.

At just which point in the building scale architects become an expensive luxury is as yet unproven. An architect, if indispensable on larger work, is indispensable on smaller work, or if not of value to the one is not of value to the other. The logical conclusion to this syllogism is to be determined by observation. An analogous situation would be in saving the electric light bill by not installing electricity. Few care to read by candle light in this modern era. Realizing this truth, those of the building trade through the experience of enjoying the co-operation of an able architect and a thrifty owner, are doing a laudable work in sponsoring correct building, which means better building. It is the prerogative of these men of the trade to expect the documents to be complete—those documents in which they place their

confidence to the extent of giving a guarantee of the contract which they take.

It is a man-to-man obligation which they expect fulfilled by having the accounts so supervised that their money will be available upon the performance of their work. The architect in return only expects performance and the owner, the greatest contributor of all, certainly is justified in expecting a dollar in building for a dollar spent. Those owners who gluttonously want \$1.10 or \$1.20 for \$1.00 can be disillusioned when the building fraternity acts harmoniously together to point out the folly of this misconception. The owners who have dollars to spend will spend them if, through the co-operation of the trades and professions, they can see that the city being built is being built well, and that their investment is substantial as well as profitable.—*East Bay Builder*.

GIVE THOUGHT TO CITY PLANNING

Intelligent city planning is an essential effort fast becoming the medium designed to make for better built cities and better citizenship in the broadest sense of the terms.

City planning comprehends the application of sound business principles to governmental activities. Who can question the soundness of planning and building cities consistent with preconceived, well-thought-out plans? The scope of city planning, however, comprehends more than laying out a city with so many streets, zones to regulate uses of properties and occupancies, and other usually accepted objectives of a city plan.

Matters of health, safety of life, transportation facilities, uses of building materials, recreational conveniences, housing, sanitation, engineering, architecture, water, power, industry, all are inter-related and inseparable from the comprehensive city plan idea. Property values and stabilization of investments are dependent on the growth and destiny of cities.

A city plan advocate aptly said: "Environment and inspiration is often more important than heredity to future generations." And these words lead to the thought of delinquents and delinquencies, crime waves and tides. So to a large extent even the problem of combatting insidious practices and organized enemies of society lies in plans by which cities are built and operated.

Public consciousness is fast coming to realize that city planning has fundamental values and basic practical humanitarian objectives which will be reflected in the better character of growing and future generations.—*Oakland Outlook*.

write practically every form of Insurance, except life*

Acids Do Not Harm these Concrete Floors—

L. A. Dreyfus Building, Rosebank, Staten Island, N. Y.

Turner Cons't. Co., E. grs & Contrs.

They're Protected with "ANTI-HYDRO"

The concrete floors in this building are constantly covered with
acids and water which would quickly deteriorate them if they were not
hardened and waterproofed with "ANTI-HYDRO."

Although these floors have been in constant use for many years,
"ANTI-HYDRO" has fully protected them from wear, water and the
action of the acids.

"ANTI-HYDRO" is a liquid integral agent that mixes easily with
the gauging water—no skilled labor is required. It hardens and water-
proofs concrete and makes it acid, alkali and oil-resisting all in *one*
operation.

For 23 years "ANTI-HYDRO" has been the accepted standard. Re-
sults are *guaranteed permanent*. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

MONTHLY DIGEST NO. 81 OF CONDITIONS IN THE COMMON BRICK INDUSTRY

Prepared by the Common Brick Manufacturers' Association of America

2121 Guarantee Title Bldg., Cleveland, O.
Published August 1, 1927

Information as of July 1, 1927

The volume of construction in the United States for the first half of the year is running true to the best January forecasts. Prognostications, based upon survey of work in the architectural offices published earlier in the year, indicated a drop in volume of between ten and twelve per cent. The reports from members of the Common Brick Manufacturers' Association indicate that their plants are running ahead of the construction volume.

This is believed to be the result of a general acceptance throughout the country of the fact that the brick house actually costs very little more than homes of less enduring type, and in the long run really costs much less. The gain in the consumption of brick is largely in residential construction.

The most convincing piece of evidence that has lately been developed to prove the economy of a brick home resulted from an investigation in Denver. For the first time, as far as is recorded, competing materials united in a comparative cost survey. The lumbermen, the cement men, and brickmen, formed a committee and requested the Architects' Small House Service Bureau, affiliated with the American Institute of Architects, to conduct the investigation.

A typical bungalow 25x35 feet in size, containing five rooms and a bath, was used for the investigation. The final result showed that the solid wall brick house, using a good quality of exterior brick,

PHILADELPHIA YESTERDAY & TODAY

HELPING to beautify Philadelphia's Parkway is not alone the task of the municipality. Private interests are co-operating in a big way to make The Parkway the most magnificent boulevard in the world. This new home-office building is now occupied by its owners.

Architects

cost exactly \$107 more than the same house built in frame. The difference between brick and stucco was even less.

This result was subscribed to by the various materials interested and its accuracy vouched for by the Architects' Small House Service Bureau. When it is considered that one repainting of this bungalow built in frame would cost more than twice the first cost difference between brick and frame, there is left no room for doubt as to which is actually the lowest cost house from the viewpoint of the owner's pocketbook.

Similar investigations in other parts of the country produce like results. It is well established that today there is only a slight first cost difference between a well built, attractive and practically everlasting brick house and the other type, which is known to be expensive to maintain and which has a limited lifetime. Brick is gaining in some other classes of construction where the very best is desired.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

MONTHLY DIGEST NO. 82 Of Conditions in the Common Brick Industry

Information as of August 1, 1927

The percentage of the total production of Brick in the United States in 1927 used in the construction of residences will be greater than the percentage of any previous year's output.

While brick has been the favorite material for most types of buildings and is holding its own in the field of commercial and institutional building, it is making notable gains in dwelling house construction.

The development of new surface effects by use of common brick, which is a local made, low cost brick manufactured in every part of the country has been an important factor in the acceptance of brick in home building. Architects always maintain that any local material is suitable for use if properly handled. Common brick as it appears in factory walls or in the back and side walls of commercial buildings was not attractive because no thought was given to appearance in the laying. It was serving a structural purpose in carrying the heavy loads and resisting fire, but the better architects of the country have found that this same safety in construction may be obtained, and at

the same time beauty, by the proper treatment of the exterior course of brickwork.

The building of homes is doing much to maintain the construction volume in nearly all the large building centers. As was anticipated the early part of the year, there is a slight decline in several classifications, but residential construction is going ahead at a little more than normal quantity.

It has been estimated that the United States in years past did not build more than 15 per cent of its homes of permanent fire-safe materials, the remaining 85 per cent of frame. The proportion this year will show a gain in brick, stone and concrete types.

The report of 147 manufacturers located in 40 states show that the production has been cut down, and that there is a slight decrease in the quantity of brick moved from the yards during the past month. That there is over-production in certain centers is shown by the stocks on hand. This will probably result in shutting down of seasonal plants earlier than usual and a reduction in the production of the all-year-round plants.

Compared with one month ago, the orders on the books are satisfactory although the figure is far below that of a like number of manufacturers a year ago at this time. No important change in price is indicated by the reports.

"ANTI-HYDRO" Keeps Elevator Pits Absolutely Dry

The concrete elevator pits in this building are permanently waterproofed with "ANTI-HYDRO". They are absolutely dry at all times.

No matter how large or how deep you build concrete pits, you can rely on "ANTI-HYDRO" to keep them dry. It waterproofs concrete against any head of water.

ANTI-HYDRO is a liquid integral agent that mixes easily with the gauging water. Any unskilled workman can do it. It both hardens and waterproofs concrete in ONE OPERATION.

During the past 23 years, "ANTI-HYDRO" installations have circled the globe. Carefully kept records fail to indicate one unsatisfactory installation. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

**PHILADELPHIA

Store (alts.), 4 West Fourth street, Wilmington, Del., \$15,700. Owners, Success Department Store, on premises. Brick, 2 stories, 70x36 feet, plate glass, marble work, general alterations. Contract awarded F. H. Keiser Co., Pottstown, Pa.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., September 9, 1927. Sealed Bids will be opened in this office at 3 p. m., October 3, 1927, for Betterments of the U. S. post office, Cohoes, N. Y. Drawings and specifications may be obtained from the custodian of the building, or at this office in the discretion of the Supervising Architect. JAS. A. WETMORE, Acting Supervising Architect.

PUBLIC NOTICE

SEALED BIDS will be received by the Board of Education of Hamilton Township, County of Atlantic, State of New Jersey, at 8.00 o'clock P. M. on Friday, October 7, 1927, at a special meeting of the said Board, to be held in the Public School Building, corner of Farragut Avenue and Second Street, May's Landing, New Jersey, for the erection and completion of a three-story Fireproof High School Building to be erected on the school grounds at the corner of Farragut Avenue and Second Street in the rear of present frame school house, May's Landing, N. J., according to the plans and specifications on file in the office of S. HUDSON VAUGHN, Architect, Room 642, Guarantee Trust Building, Atlantic City, New Jersey, where said plans and specifications may be seen, or the Architect will loan to prospective bidders a copy of the said plans and specifications on the deposit of \$50.00 by the borrower of the plans, which amount will be returned providing a bid in regular form is submitted to

the Board on one of the five groups advertised and the plans and specifications delivered in good condition, to the office of the Architect within one week after bids are opened. Said bids are to be opened and read in Public at the aforesaid time and place.

Five separate bids will be received on five separate groups of the work to be done, together with alternate bids as called for by the specifications.

Construction Work Group No. 1
Plumbing Work Group No. 2
Electric Work Group No. 3
Heating and Ventilating Work Group No. 4
Sewage Disposal Work Group No. 5

Each bid must be accompanied by a certified check, payable to JAMES F. CANAZZA, Custodian, in the amount of ten percent of the bid, or cash in equal amount.

The certified check or cash, above stated, which accompanies each bid is intended as a guarantee that if the Contract is awarded to the bidder, he will enter into a Contract with said Board of Education, and give Bond, as required by specifications, and if for any reason the successful bidder should fail or refuse to execute the Contract and Bond as required, the certified check or cash accompanying said bid becomes the property of the Board of Education aforesaid and the proceeds of said check deposited to the credit of said Board.

All checks will be returned within one week after the bids have been opened, excepting the checks of the lowest and next lowest bidder on each section or group of the work.

Surety Company Bond, in the full amount of the Contract, must be furnished by the successful bidder and all bids must be made on "Bidding Proposals" as provided in the specification under Section "A."

If the bidder fails to file with his bid, in addition to his certified check, a proper Consent or Bidder's Bond, executed by officers in authority for said Surety Company, naming the surety that will go on his Bond, the bid will be considered irregular.

Contract will be awarded, if awarded at all, subject to the sale of bonds to finance said work.

The right is reserved to reject any or all bids.

By order of the Board of Education of Hamilton Township, Atlantic County, New Jersey.

ARCHIE H. SMITH,
District Clerk.

William J. Miller, formerly with Hopp'e & Miller, has opened an office at 1127 Somerville Avenue, Philadelphia. Bell phone, Michigan 2986.

BUILDING PERMITS FOR JULY, 1927, FALL BELOW LAST YEAR

Permits for construction work in the State during July, 1927, were 11 per cent. below the total for July, 1926, according to reports received at the Department of Labor and Industry from building inspection offices in 35 cities and boroughs. The cost of the construction work contemplated by the 4,326 permits issued during July, 1927, was estimated to be \$21,633,613. New building work comprises 85 per cent., or \$18,468,459, of the July building total and the balance of \$3,165,154 is to be expended for additions, alterations, and repairs to buildings. The reduced volume of building is in new con-

struction work, the total for alteration and repair work being nearly the same as July, last year.

Thirteen cities and boroughs report gains in building over July, 1926, and 22 show decreases. The gain in Wilkes-Barre was \$1,303,294, or 213 per cent., and was the largest gain reported. Four other cities showed gains of more than \$100,000 over July, 1926. These 4 cities and their gains are: Uniontown, \$621,936; Williamsport, \$193,990; New Castle, \$167,575, and Harrisburg, \$107,765.

Of the 22 cities that report a reduced volume of building in July, 1927, compared to July, 1926, 11 show losses in excess of \$100,000 as follows:

City	Amount of decrease	Percent. of decrease
Philadelphia	\$1,826,795	14.1
Pittsburgh	786,682	21.8
Allentown	555,496	52.5

Reading	334,185	46.2
Warren	305,069	91.0
Erie	284,660	50.6
Altoona	254,577	38.0
York	223,250	89.7
Easton	189,412	61.2
Lancaster	140,160	59.1
Bethlehem	104,863	42.6

Cities that report decreases amounting to less than \$100,000 include: Ambridge, Bristol, Carlisle, Donora, Hazleton, Johnstown, Meadville, Monessen, Monongahela, Pottsville and Sunbury.

Building permit records for the first 7 months of 1927 are available for 31 cities and boroughs and show that permits were granted for the erection, alteration, or repair of 29,526 buildings at an estimated cost of \$132,793,241. Compared with the building total for the same cities and boroughs for the corresponding period in 1926, the volume of building in

1927 is \$14,465,567, or 9.8 per cent., less than last year.

The comparison shows that building operations in 16 cities have gained over the first 7 months of last year and have shown decreases in 15 cities. The decreases for the 15 cities, however, overbalance the gains in the 16 cities by 285 per cent. This is due principally to the fact that the reduced volume of building in Philadelphia alone exceeds the gains of all 16 cities combined. The building volume in Philadelphia for the first 7 months of 1927 was \$10,514,805 below last year while the gains in 16 cities totaled \$5,011,987.

Cities in addition to Philadelphia, that show building losses for 7 months of more than a half-million dollars over last year are: Easton, \$772,824; Harrisburg, \$517,970; Hazleton, \$657,529; Pittsburgh, \$3,879,268, and Reading, \$928,-

Williamsport	37	403,115	32	15,090	40	196,245	52	27,970
York	25	15,137	38	21,583	31	227,610	47	32,360
Total	2,453	\$18,468,459	1,873	\$3,165,154	2,735	\$21,168,016	2,014	\$3,204,502

275. Cities whose losses range from \$100,000 to \$500,000 include Altoona, Ambridge, Bradford, Donora, Erie, Meadville, Warren, and Williamsport. The loss in Sunbury amounted to \$25,772, and was the smallest loss reported.

New Castle with a building gain of \$1,048,930 for 7 months tops the list of the 16 cities showing increases. Eight cities show gains ranging from \$100,000 to \$1,000,000 as follows: Uniontown, \$973,971; Scranton, \$777,127; Wilkes-

Barre; \$712,840; Oil City, \$456,626; York, \$268,558; Bethlehem, \$189,549; Carlisle, \$141,892, and Lancaster, \$119,506. Gains in 7 other cities amounted to less than \$100,000.

The July building permits, classified according to types of buildings to be erected, show a few interesting changes when compared with the record for July, a year ago. Last July nearly half of the building costs were apportioned to residential buildings. In July, 1927, residential

buildings make up only one-fourth of the building total. Permits for one-family dwellings are 10 per cent. higher than last year while permits for two-family dwellings and apartment houses show decreases. The average construction cost of one-family dwellings in July, 1927, is shown to be \$900 less than last year, dropping from \$4,987 in July, 1926, to \$4,087 in July, 1927.

In the non-residential building group permits for the construction of amusement places, factories and shops, garages, and office buildings show largest declines. Permits for school buildings and stores are somewhat higher than last year.

*Not included in comparative total.

**Includes figures for Carrick Borough.

Washington, Sept.—The greatest volume of construction operations ever carried on in this country during a single month was established in August, according to statistics just compiled by the Associated General Contractors of America. Registering an increase of eight per cent over the July volume, building activities last month reached a total well above the previous record, set in July 1926.

All types of building, it is stated, are included in these statistics, which are based upon actual shipments of basic construction materials.

Last month's construction record brought the total volume for the first eight months of this year up to a figure four per cent in excess of the total registered for the corresponding period of 1926. Leading builders consider this to be especially significant in view of the fact that the total volume for the twelve months of last year was the greatest ever recorded for a similar period.

A huge volume of contracts already awarded for future construction work bolsters forecasts that a new mark will be set by 1927. The volume of awards made during the first seven months of this year exceeds by seven per cent the corresponding total for 1926.

A scale which places the 1913 average at 100 as its basis shows the index number for the August volume of actual operations to be 238. Figures for preceeding months are: January, 129; February, 121; March, 135; April, 165; May, 197; June, 212; July, 221.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

"I DIDN'T KNOW"

is poor consolation to any builder when sudden emergency—fire, wind, etc.—puts his insurance protection to an unexpected test and finds it wanting.

If you do not know that this is a form of insurance featured by the "Old North America" any of our agents will be glad to give you full information and advice on the proper protection you should have, without any obligation.

"ANTI-HYDRO" Keeps Elevator Pits Absolutely Dry

The concrete elevator pits in this building are permanently waterproofed with "ANTI-HYDRO". They are absolutely dry at all times.

No matter how large or how deep you build concrete pits, you can rely on "ANTI-HYDRO" to keep them dry. It waterproofs concrete against any head of water.

ANTI-HYDRO is a liquid integral agent that mixes easily with the gauging water. Any unskilled workman can do it. It both hardens and waterproofs concrete in ONE OPERATION.

During the past 23 years, "ANTI-HYDRO" installations have circled the globe. Carefully kept records fail to indicate one unsatisfactory installation. Use "ANTI-HYDRO" on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.
